# 1 Foreword

### 1.1 Notes on the documentation

This description is intended exclusively for trained specialists in control and automation technology who are familiar with the applicable national standards.

For installation and commissioning of the components, it is absolutely necessary to observe the documentation and the following notes and explanations.

The qualified personnel is obliged to always use the currently valid documentation.

The responsible staff must ensure that the application or use of the products described satisfies all requirements for safety, including all the relevant laws, regulations, guidelines, and standards.

#### **Disclaimer**

The documentation has been prepared with care. The products described are, however, constantly under development.

We reserve the right to revise and change the documentation at any time and without notice.

No claims to modify products that have already been supplied may be made on the basis of the data, diagrams, and descriptions in this documentation.

#### **Trademarks**

Beckhoff®, TwinCAT®, TwinCAT/BSD®, TC/BSD®, EtherCAT®, EtherCAT G®, EtherCAT G10®, EtherCAT P®, Safety over EtherCAT®, TwinSAFE®, XFC®, XTS® and XPlanar® are registered and licensed trademarks of Beckhoff Automation GmbH.

If third parties make use of designations or trademarks used in this publication for their own purposes, this could infringe upon the rights of the owners of the said designations.

#### **Patents**

The EtherCAT Technology is covered, including but not limited to the following patent applications and patents:

EP1590927, EP1789857, EP1456722, EP2137893, DE102015105702 and similar applications and registrations in several other countries.

EtherCAT® is registered trademark and patented technology, licensed by Beckhoff Automation GmbH, Germany

#### Copyright

© Beckhoff Automation GmbH & Co. KG, Germany.

The distribution and reproduction of this document as well as the use and communication of its contents without express authorization are prohibited.

Offenders will be held liable for the payment of damages. All rights reserved in the event that a patent, utility model, or design are registered.

# 1.2 For your safety

#### Safety regulations

Read the following explanations for your safety.

Always observe and follow product-specific safety instructions, which you may find at the appropriate places in this document.

#### **Exclusion of liability**

All the components are supplied in particular hardware and software configurations which are appropriate for the application. Modifications to hardware or software configurations other than those described in the documentation are not permitted, and nullify the liability of Beckhoff Automation GmbH & Co. KG.

#### Personnel qualification

This description is only intended for trained specialists in control, automation, and drive technology who are familiar with the applicable national standards.

#### Signal words

The signal words used in the documentation are classified below. In order to prevent injury and damage to persons and property, read and follow the safety and warning notices.

#### Personal injury warnings

#### **▲ DANGER**

Hazard with high risk of death or serious injury.

#### **⚠ WARNING**

Hazard with medium risk of death or serious injury.

#### **A** CAUTION

There is a low-risk hazard that could result in medium or minor injury.

#### Warning of damage to property or environment

#### NOTICE

The environment, equipment, or data may be damaged.

#### Information on handling the product

This information includes, for example: recommendations for action, assistance or further information on the product.

# 1.3 Notes on information security

The products of Beckhoff Automation GmbH & Co. KG (Beckhoff), insofar as they can be accessed online, are equipped with security functions that support the secure operation of plants, systems, machines and networks. Despite the security functions, the creation, implementation and constant updating of a holistic security concept for the operation are necessary to protect the respective plant, system, machine and networks against cyber threats. The products sold by Beckhoff are only part of the overall security concept. The customer is responsible for preventing unauthorized access by third parties to its equipment, systems, machines and networks. The latter should be connected to the corporate network or the Internet only if appropriate protective measures have been set up.

In addition, the recommendations from Beckhoff regarding appropriate protective measures should be observed. Further information regarding information security and industrial security can be found in our https://www.beckhoff.com/secquide.

Beckhoff products and solutions undergo continuous further development. This also applies to security functions. In light of this continuous further development, Beckhoff expressly recommends that the products are kept up to date at all times and that updates are installed for the products once they have been made available. Using outdated or unsupported product versions can increase the risk of cyber threats.

To stay informed about information security for Beckhoff products, subscribe to the RSS feed at <a href="https://www.beckhoff.com/secinfo">https://www.beckhoff.com/secinfo</a>.

# 2 Overview

**OPC** Unified Architecture (OPC UA) is the next generation of the familiar OPC standard. This is a globally standardized communication protocol via which machine data can be exchanged irrespective of the manufacturer and platform. OPC UA already integrates common security standards directly in the protocol. Another major advantage of OPC UA over the conventional OPC standard is its independence from the COM/DCOM system.

Detailed information on OPC UA can be found on the web pages of the OPC Foundation.

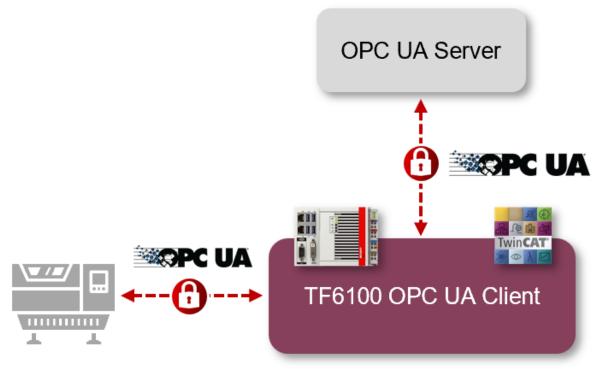

The TwinCAT 3 Function TF6100 OPC UA consists of several software components that enable data exchange with TwinCAT based on OPC UA.

The following table provides an overview of the individual product components.

Software component	Description
TwinCAT OPC UA Server	Provides an OPC UA Server interface so that UA clients can access the TwinCAT runtime.
TwinCAT OPC UA Client	Provides OPC UA Client functionality to enable communication with other OPC UA Servers based on PLCopen-standardized function blocks and an easy-to-configure I/O device.
TwinCAT OPC UA Configurator	Graphical user interface for configuring the TwinCAT OPC UA Server.
TwinCAT OPC UA Sample Client	Graphical sample implementation of an OPC UA Client in order to carry out a first connection test with the TwinCAT OPC UA Server.
TwinCAT OPC UA Gateway	Wrapper technology that provides both an OPC COM DA Server interface and OPC UA Server aggregation capabilities.

This documentation describes the TwinCAT 3 OPC UA Client, which is a software component that provides an OPC UA Client interface for the TwinCAT Runtime environment. The TwinCAT 3 OPC UA Client can therefore be used to initiate connections with OPC UA servers in order to exchange data with them.

# **OPC UA Server**

The technical use cases range from TCP-based (and therefore non-real-time capable) machine-to-machine communication to machine-to-cloud communication if the OPC UA server to be connected is located in the cloud.

The TwinCAT OPC UA Client is technically available in two different variants:

- 1. As a TwinCAT I/O device
- 2. As PLC function blocks

#### **Further information**

- For an overview of any functional differences, we recommend our article <u>Supported functions</u> [<u>\bar{19}</u>].
- Please note the <u>System Requirements</u> [▶ 10] for this product.
- For a quick introduction to the product, we recommend our articles <u>Installation [▶ 10]</u> and <u>Quick start [▶ 15]</u>.

# 3 Installation

# 3.1 System Requirements

The following system requirements apply for the installation and operation of this product.

#### Client

Technical data	Description
Operating system	Windows 10
	Windows CE 6/7
	Windows Server 2022
Target platforms	PC architecture (x86, x64, ARM)
.NET Framework	
TwinCAT version	TwinCAT 3
Minimum TwinCAT installation level	TwinCAT 3 XAE, XAR
Required TwinCAT license	TF6100 TC3 OPC UA

#### Sample Server

Technical data	Description
Operating system	Windows 10 (>= 21H2)
	Windows Server 2022
Target platforms	PC-Architektur (x86, x64)
.NET Framework	4.8.1
TwinCAT version	
Minimum TwinCAT installation level	
Required TwinCAT license	

#### 3.2 Installation

Depending on the TwinCAT version and operating system used, this TwinCAT 3 Function can be installed in different ways, which are described in more detail below.

#### NOTICE

#### **Update installation**

An update installation always uninstalls the previous installation. Please make sure that you have backed up your configuration files beforehand.

#### **TwinCAT Package Manager**

If you are using TwinCAT 3.1 Build 4026 (and higher) on the Microsoft Windows operating system, you can install this function via the TwinCAT Package Manager, see <u>Installation documentation</u>.

Normally you install the function via the corresponding workload; however, you can also install the packages contained in the workload individually. This documentation briefly describes the installation process via the workload.

#### Command line program TcPkg

You can use the TcPkg Command Line Interface (CLI) to display the available workloads on the system:

tcpkg list -t workload

You can use the following command to install the workload of a function. Shown here using the example of the TF6100 TwinCAT OPC UA Client:  $\frac{1}{2} \left( \frac{1}{2} \right) = \frac{1}{2} \left( \frac{1}{2} \right) \left( \frac{1}{2}$ 

tcpkg install tf6100-opc-ua-client

#### TwinCAT Package Manager UI

You can use the **U**ser Interface (UI) to display all available workloads and install them if required. To do this, follow the corresponding instructions in the interface.

#### **NOTICE**

#### **Unprepared TwinCAT restart can cause data loss**

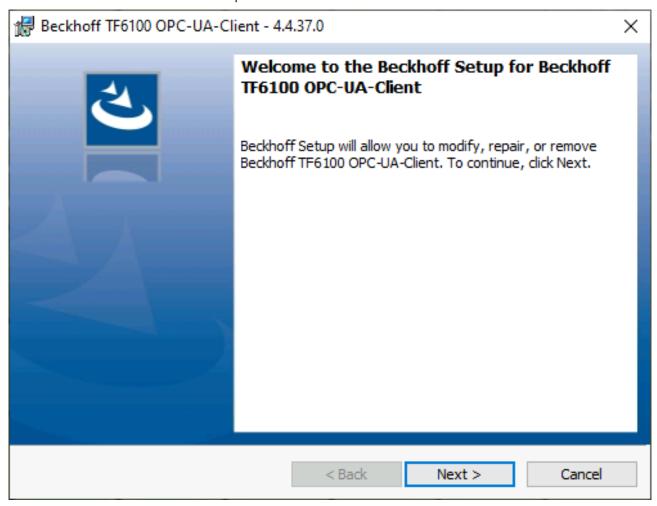

The installation of this function may result in a TwinCAT restart.

Make sure that no critical TwinCAT applications are running on the system or shut them down in an orderly manner first.

#### Setup

If you are using TwinCAT 3.1 Build 4024 on the Microsoft Windows operating system, you can install this function via a setup package, which you can download from the Beckhoff website at <a href="https://www.beckhoff.com/download">https://www.beckhoff.com/download</a>.

Depending on the system on which you need the function, the installation can be done on either the engineering or runtime side. The following screenshot shows an example of the setup interface using the TF6100 TwinCAT OPC UA Client setup.

To complete the installation process, follow the instructions in the Setup dialog.

#### NOTICE

#### **Unprepared TwinCAT restart can cause data loss**

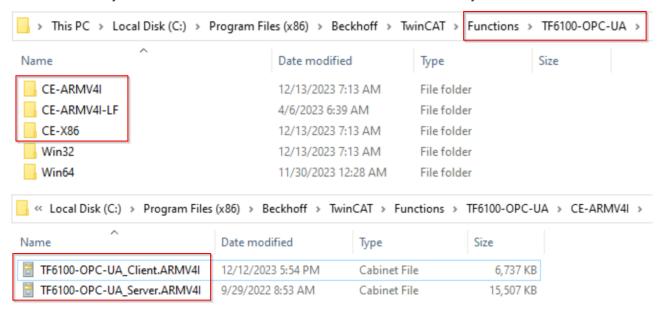

Installing this function may cause TwinCAT to restart.

Make sure that no critical TwinCAT applications are running on the system or shut them down in an orderly manner first.

#### Windows CE

If you are using Microsoft Windows CE as your operating system, you can install this function via the respective CAB files, which are delivered with the setup or TcPkg workload. The CAB files are usually stored in the subdirectory CE-ARMC4I and CE-X86 relative to the installation directory of the function.

From there they can be transferred to the Windows CE device via file transfer and executed there. The CAB files then install and register the function on the respective system.

Always use the appropriate CAB file for your system. Specifically, this means

- CE-ARMV4I: ARM-based devices, e.g. CX8190, CX9020
- CE-X86: x86-based devices, e.g. CX51xx, CX52xx, CX20xx

The CAB file can be transferred to the device either via the CF/SD card or the FTP server integrated in Windows CE.

#### **Device restart**

After installing this function, a device restart is required so that the function can be used.

# 3.3 Licensing

The TwinCAT 3 function can be activated as a full version or as a 7-day test version. Both license types can be activated via the TwinCAT 3 development environment (XAE).

The licensing of a TwinCAT 3 function is described below. The description is divided into the following sections:

- Licensing a 7-day trial version [▶ 12]
- Licensing a full version [▶ 14]

Further information on TwinCAT 3 licensing can be found in the Beckhoff Information System in the documentation "TwinCAT 3 Licensing").

#### Licensing the 7-day test version of a TwinCAT 3 Function

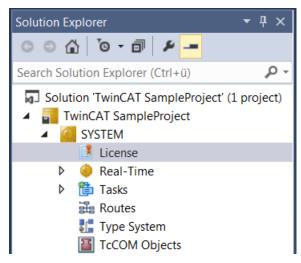

A 7-day test version cannot be enabled for a TwinCAT 3 license dongle.

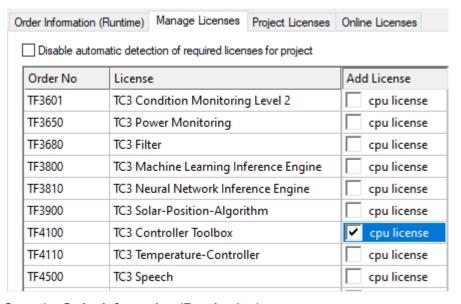

- 1. Start the TwinCAT 3 development environment (XAE).
- 2. Open an existing TwinCAT 3 project or create a new project.

- 3. If you want to activate the license for a remote device, set the desired target system. To do this, select the target system from the **Choose Target System** drop-down list in the toolbar.
  - ⇒ The licensing settings always refer to the selected target system. When the project is activated on the target system, the corresponding TwinCAT 3 licenses are automatically copied to this system.
- 4. In the **Solution Explorer**, double-click **License** in the **SYSTEM** subtree.

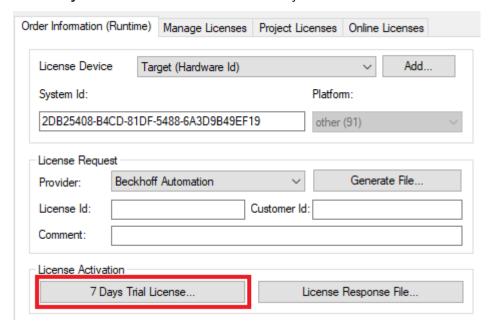

- ⇒ The TwinCAT 3 license manager opens.
- 5. Open the **Manage Licenses** tab. In the **Add License** column, check the check box for the license you want to add to your project (e.g. "TF4100 TC3 Controller Toolbox").

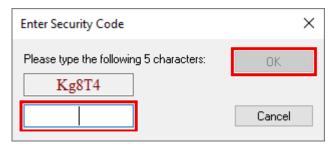

- 6. Open the Order Information (Runtime) tab.
  - ⇒ In the tabular overview of licenses, the previously selected license is displayed with the status "missing".

7. Click **7-Day Trial License...** to activate the 7-day trial license.

⇒ A dialog box opens, prompting you to enter the security code displayed in the dialog.

- 8. Enter the code exactly as it is displayed and confirm the entry.
- 9. Confirm the subsequent dialog, which indicates the successful activation.
  - ⇒ In the tabular overview of licenses, the license status now indicates the expiry date of the license.
- 10. Restart the TwinCAT system.
- ⇒ The 7-day trial version is enabled.

#### Licensing the full version of a TwinCAT 3 Function

A description of the procedure to license a full version can be found in the Beckhoff Information System in the documentation "TwinCAT 3 Licensing".

# 4 Technical introduction

### 4.1 Quick start

The following chapter provides a quick start to the TwinCAT OPC UA I/O Client. In these instructions, the connection to a Sample OPC UA Server is set up, which offers some variables in its namespace. These variables are added to the process image of the TwinCAT OPC UA I/O Client and then linked to PLC variables.

#### Sample OPC UA Server

The Sample OPC UA Server is delivered together with the TF6100 OPC UA Client setup and is located in the <u>installation directory</u> [ > 21] of the client. Alternatively, you can also use the TwinCAT OPC UA Server instead of the Sample OPC UA Server to provide a few variables via OPC UA.

The steps are described below in the order in which they are performed:

- · Starting the Sample OPC UA Server
- · Creating a TwinCAT project
- · Reading the OPC UA variables
- · Starting the code generation

#### Starting the Sample OPC UA Server

- 1. In Windows Explorer, navigate to the installation directory of the TF6100 FunctionSample and then to the subdirectory "SampleServer".
- 2. Start the file TcOpcUaSampleServer.exe as administrator.
- ⇒ The server is started in a console window and can then be accessed at the following OPC UA URL:

opc.tcp://localhost:48030

You can confirm the message regarding the limited runtime.

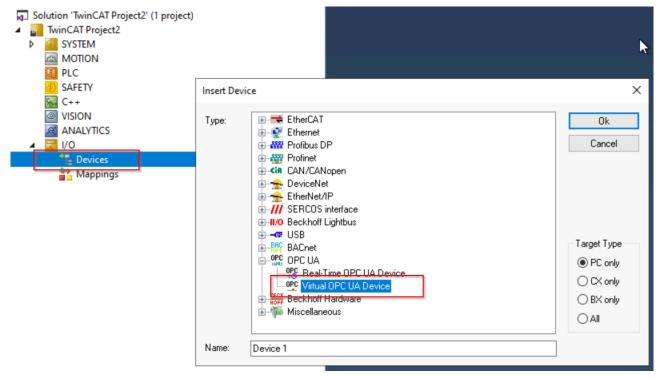

#### Creating a TwinCAT project

- 1. Open the TwinCAT XAE Shell.
- 2. In the **File** menu, select the command **New > Project**.
- 3. Add a PLC project to the project.
- ⇒ A new TwinCAT project including PLC project was created.

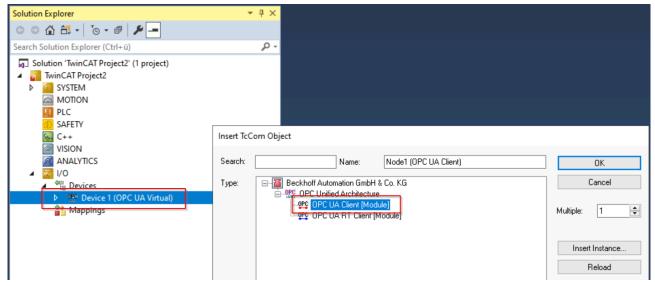

#### Reading the OPC UA variables

- ✓ In this step, the TwinCAT OPC UA Client is used to establish a connection to the server and read in the variables available there.
- Add a new I/O device to the TwinCAT project.
   Use "OPC UA Virtual Device" as the device type

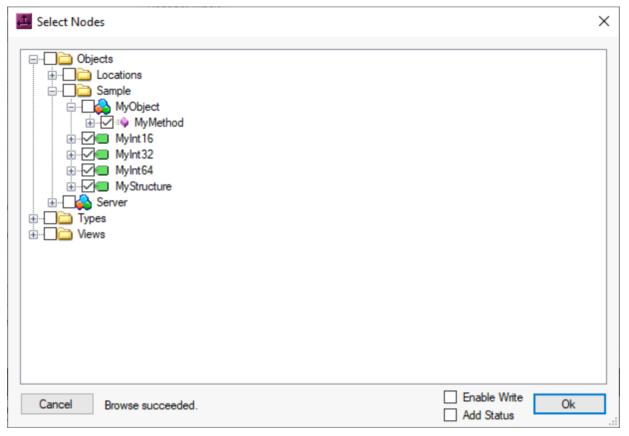

2. Add an OPC UA Client to the device

- 3. Open the settings of the OPC UA Client by double-clicking on the client.
- 4. Navigate to the **Settings** tab. Enter the server URL of the OPC UA Server. In this sample this is "opc.tcp://localhost:48030".

5. Click **Add Nodes**. A connection to the server is established and the address space of the server is displayed in a separate dialog.

- 6. Select the nodes shown above and click the **Ok** button.
- ⇒ The variables and the method for the process image of the client have been added.

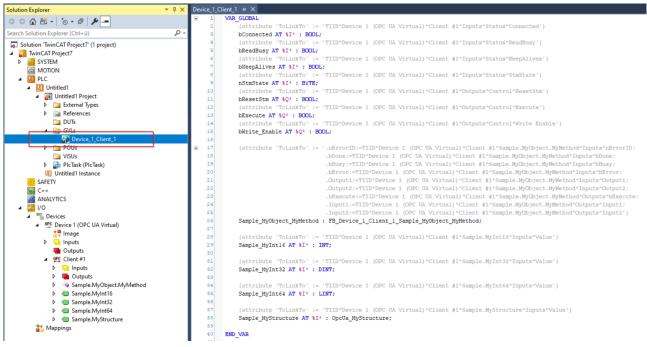

#### Starting the code generation

- ✓ Automatic code generation should be used to generate PLC variables to match the added OPC UA nodes. The generated PLC variables are automatically linked to the nodes. Alternatively, you can perform the mapping manually.
- 1. Double-click the OPC UA client.
- 2. In the Settings tab, select the DataType Settings

- 3. Click the Create Plc Code button, which starts the code generation.
  - ⇒ The code generator creates a GVL in the existing PLC project whose name is derived from the OPC UA Client device name. PLC variables have now been automatically created within the GVL and linked to the corresponding nodes in the process image of the I/O device via the "TcLinkTo" pragma.

- 4. Activate the configuration.
- ⇒ The values of the OPC UA nodes are read from the server and written to the PLC variables via the mapping.

#### Further information on calling the method

Further PLC logic is required to call the method. For this purpose, a suitable function block has already been created by the code generation and provided with the corresponding input/output parameters, see chapter Method calls [ > 24].

### 4.2 Software architecture

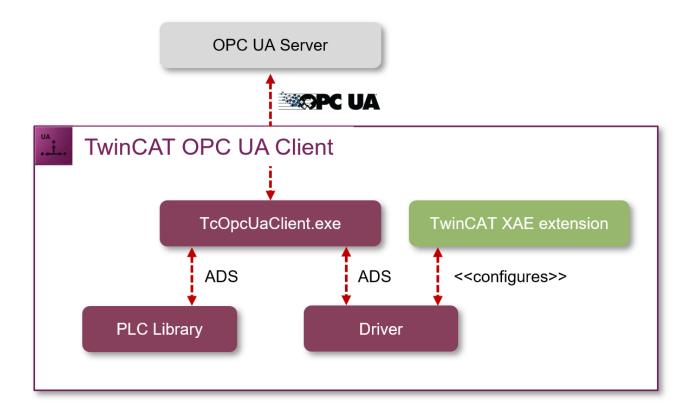

You do not need to know the internal software architecture of this product to use it, but it may be of interest in some cases. We will therefore briefly present it to you below.

The TwinCAT OPC UA Client essentially consists of the following components:

- · The process in the operating system
- · The communication driver in real-time
- · The TwinCAT XAE extension
- · The PLC library

The interaction of the individual components is described in more detail in the following diagram:

#### Process in the operating system

The process in the operating system (TcOpcUaClient.exe) takes care of the OPC UA protocol functions and makes them available via an ADS server so that the TwinCAT real-time components (e.g. the driver or the PLC library) can access them.

#### Communication driver in real-time

The driver in real-time is responsible for the communication of the I/O device with the process in the operating system. It converts the configured process data into ADS telegrams, which are exchanged with the process in order to be converted into OPC UA commands. There is an engineering component in TwinCAT XAE for the configuration of the communication connection and the choice of data points.

#### **TwinCAT XAE Extension**

The engineering component in TwinCAT XAE provides a graphical configuration interface for the I/O device. This means that variables can be read from OPC UA servers and added to the process image so that they can be processed later at runtime.

#### **PLC library**

The PLC library provides the OPC UA functions of the process in the operating system for the PLC logic. Similar to the driver, the PLC library communicates with the process via ADS in order to access the OPC UA functions.

# 4.3 Supported functions

The TwinCAT OPC UA Client enables access to the OPC UA server directly from the real-time logic.

#### **General functionality**

OPC UA defines a wide range of functions that may not be able to be mapped 1:1 to a PLC real-time environment. The following table provides an overview of the current functionality of the TwinCAT OPC UA Client. Missing features will be delivered in the future - as usual - in the form of updates.

Feature	PLCopen function blocks	I/O Client
Polling	x	x
Subscriptions	-	x
Method calls	x	x
Basic data types according to IEC61131	x	x
Structures	_	x
Arrays of basic data types according to IEC61131	x	X
Arrays of structures	-	x
Arrays with fixed length	x	х
Arrays with dynamic length	-	-
Security at transport layer with X.509 certificates (self-signed + CA)	X	X
Security at application layer with user name/password	X	Х
Security at application layer with X.509 certificates	X	Х
Communication with None/None endpoint	X	Х
Communication with Basic128 endpoint	x	х
Communication with Basic128Rsa15 endpoint	X	X
Communication with Basic256 endpoint	x	x
Communication with Basic256Sha256 endpoint	X	X

#### Basic data types according to IEC61131

For the reading and writing of data, the data type of the OPC UA Node must be assigned to the TwinCAT data type (mapping). The assignment of basic data types is described in the standardized information model "PLCopen OPC UA Information Model for IEC 61131-3" and is listed below. You can apply this mapping both to the PLCopen function blocks and to the TwinCAT OPC UA I/O Client.

PLC data type	OPC UA data type
BOOL	Boolean
SINT	SByte
USINT	Byte
INT	Int16
DINT	Int32
STRING	String
BYTE	USint
REAL	Float
LREAL	Double
UINT	UInt16
UDINT	UInt32
LINT	Int64
ULINT	UInt64
DT	DateTime
TIME	Int64
LTIME	Int64

# 4.4 Application directories

This application uses various directories to store relevant information, such as configuration or certificate files

#### Installation directory

The base installation directory of the application is relative to the TwinCAT installation directory.

%TcInstallDir%\Functions\TF6100-OPC-UA

The application is then installed in the following directory below this directory:

%TcInstallDir%\Functions\TF6100-OPC-UA\Win32\Client

#### **Certificate directory**

Certificate files, which are used to establish a secure communication connection, are stored in the following directory:

%ProgramData%\Beckhoff\TF6100-OPC-UA\TcOpcUaClient\PKI

#### Log files

Log files are stored in the following directory:

%ProgramData%\Beckhoff\TF6100-OPC-UA\TcOpcUaClient\Logs

# 4.5 Reading variables

Variable values can be read from an OPC UA server via the TwinCAT OPC UA I/O Client. The values can be sampled using various mechanisms, which are described in more detail below.

The various settings in this context are made in the configuration pages of the I/O device. The **Process Data Configuration** area shows various parameters for setting the different modes of data collection from a server.

The TwinCAT OPC UA I/O Client offers three different modes for data collection:

- · Polling (cyclic reading/writing)
- Subscriptions
- OnTrigger

#### Polling (cyclic reading/writing)

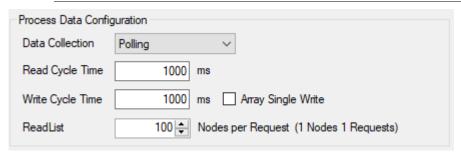

One of the possible types of data collection is cyclic reading and writing. Time intervals are defined for both reading and writing. You can also specify how many variables are to be read in one read command.

#### Writing variables in polling and subscription mode

When writing, please note that writing only takes place when the value changes. If no value change has taken place in the configured variables at the end of a cycle, no new value is written.

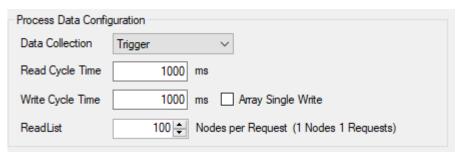

Parameter	Description
Read Cycle Time	Specifies how fast variables are cyclically read.
Write Cycle Time	Defines how often a write command is triggered on the OPC UA channel. If a variable value changes several times within a specific cycle time, only the last value is written to the OPC UA channel. If no configured value has changed in the cycle time, no write command is triggered.
ReadList	Read commands on the OPC UA channel are bundled to save bandwidth. This parameter specifies how many variables are collected in a single read command on the OPC UA channel. The labeling behind it indicates how many read commands arise from the current configuration.
Array Single Write	If a value in an array is changed, a write operation is only carried out for this value on the OPC UA channel when activated. If not activated, the entire array is always written.

#### **OnTrigger**

In addition, there is an option to trigger reading and writing via trigger variables. For each OPC UA Client device there is a trigger variable (it can be found under Outputs/Control/Execute) that can be connected to a variable from the PLC and set if required. This option is suitable, for example, if data is only to be read from an OPC UA Server when a certain event occurs in the PLC. If the trigger variable remains permanently set, the data collection type behaves in the same way as the cyclic configuration.

When writing, on the other hand, a value is written in each cycle if the trigger variable is set. No change in value is considered here.

#### **Subscriptions**

The third and last way of data collection is to use subscriptions. The I/O client registers a subscription with the connected OPC UA Server. The parameters described below can be specified for Publish Interval, Lifetime Count and Keepalive Count.

Subscription mode is primarily intended for reading variables. If you write values in this mode, the same behavior applies as for cyclical writing (see above).

Parameter	Description
Publish Interval	After the specified time the connected OPC UA Server checks where there are new notification packets for the Client. If several value changes occur in a publishing interval, only the last value is transferred.
Lifetime Count	The OPC UA Client is responsible for sending a PublishRequest to the server. In the PublishResponse, the server returns the respective notification packages. The Lifetime Count indicates after how many failed PublishRequests from the client the server deletes the subscription. The calculated duration is shown in brackets (in the sample 1200 multiplied by 1000 ms = 20 minutes).
Keepalive Count	If the server does not have new notification packets for the client, it will not return any data. The Keepalive Count indicates after how many missed messages the server would send an empty message to the client to indicate that it is still active and the subscription is still in place.

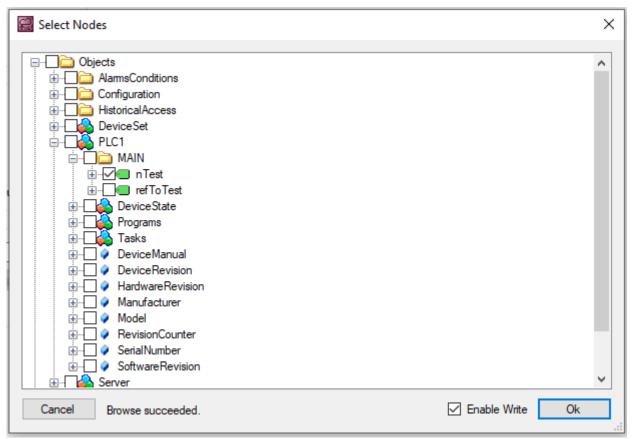

# 4.6 Writing variables

To enable the writing of variables, several conditions must be met:

- 1. The flag "Enable Write" must be set for the variable. This can be done either during the adding process via the button **Add Nodes** or afterwards in the parameter settings of the variable.
- 2. Before a write command, the "Write Enable" output for the I/O client must be enabled globally. Only then are the write commands generated.
- 3. In the "Polling" and "Subscriptions" modes, writing only takes place after a value change within the I/O client. This is particularly important for server restarts. After a server restart, values written once in these modes are not automatically written again, as another OPC UA Client could have written a new value in the meantime and this would then be overwritten by an "old" value.

#### Setting Enable Write for a variable

In order to add not only an input (Read) element but also an output (Write) element for a variable in the process image, it must be enabled explicitly. This can be done by using the **Add Nodes** dialog while adding the variables, for example:

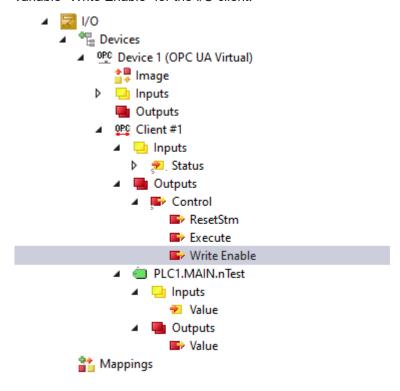

Alternatively, this setting can be enabled/disabled at a later stage via the configuration parameters of the variables in the process image.

Attributes		
Nodeld: ns=4;s=MAIN.nTest		
NsName: um:BeckhoffAutomation:Ua:PLC1		
Enable Write Provide timestamp and status code variables		
Name		Value
Nodeld		ns=4;s=MAIN.nTest
NodeClass		2
BrowseName		4:nTest
DisplayName		nTest
Description		
WriteMask 0		
UserWriteMask		0
Value		0
Data Type		i=4
ValueRank		-1
ArrayDimensions		
AccessLevel		3
UserAccessLevel		3
MinimumSamplingInterval		0
Historizing		False

#### **Enabling write access globally**

Before write commands can be sent, they must be enabled globally. This is done by setting the output variable "Write Enable" for the I/O client:

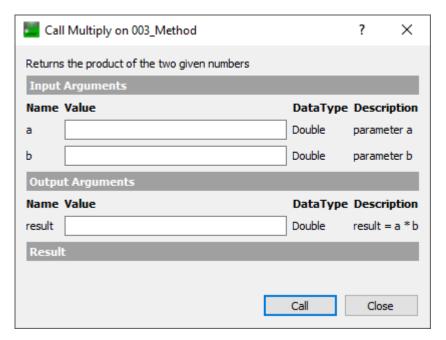

# 4.7 Method calls

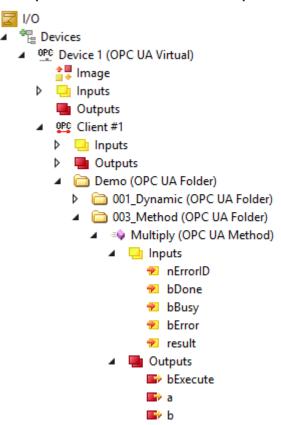

The TwinCAT OPC UA I/O Client supports the calling of server methods. You can add a method to the process image like any other variable. The "input arguments" of the method are then available as output variables in the process image, whereas the "output arguments" are added as input variables. Additional input and output variables, e.g. bExecute, bBusy, bError, are added to the process image so that the method can be called.

**Example: Method on server** 

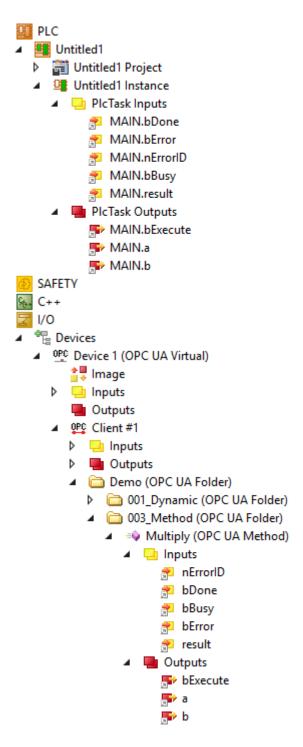

#### Example: Method after addition to the process image

You can then create a mapping between the input/output variables and the PLC variables.

## Calling of a method

To call a method, set the output variable bExecute to TRUE. You can check whether the method call has been completed and whether it was successful via the input variables nErrorID, bDone, bBusy and bError.

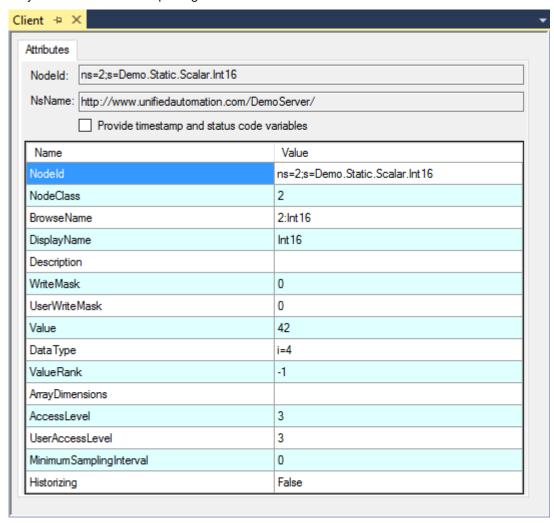

Version: 1.0.0

a	LREAL	3
b	LREAL	42
result	LREAL	126
bExecute	BOOL	TRUE
nErrorID	DINT	0
bDone	BOOL	TRUE
bError	BOOL	FALSE
bBusy	BOOL	FALSE

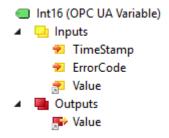

# 4.8 Timestamp and StatusCode

If you double-click on a node in the process image, you will see the UA attributes with their current values as they were at the time of opening the window.

Further variables that can be used for diagnostic purposes are added to the process image using the check box **Provide timestamp and status code variables**.

# 4.9 Structures

The OPC UA I/O Client supports read/write procedures with structured data types (StructuredTypes). You can also add StructuredTypes to the process image like any other variable. When adding a StructuredType to the process image, the type to be parsed is added to the TwinCAT type system so that, for example, it can simply be used by a PLC application.

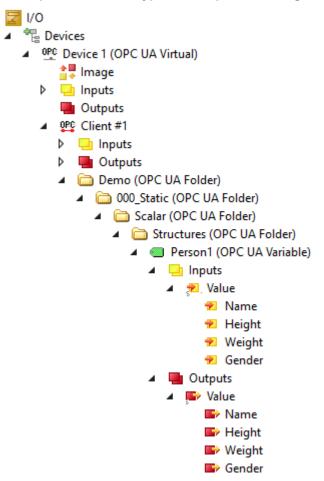

**Example: StructuredType on the server** 

✓ Value	
SourceTimestamp	17.12.2021 12:18:50.450
SourcePicoseconds	0
ServerTimestamp	17.12.2021 12:18:52.887
ServerPicoseconds	0
StatusCode	Good (0x00000000)
✓ Value	Person
Name	John Wayne
Height	193
Weight	77
Gender	0 (Male)
✓ DataType	Person
NamespaceIndex	2
IdentifierType	Numeric
Identifier	543210

In this example the server contains a node of the structured data type "Person", which contains various member variables (Name, Height, Weight, Gender).

#### Example: StructuredTypes in the process image

After you have added a node to the process image, the process image contains the node and also the structural information of the type, e.g. whether individual member variables of the node should be read or written.

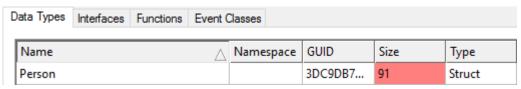

#### StructuredTypes in the TwinCAT type system

The data type is added to the type system of TwinCAT. The "Value" tree items then have this data type.

You can also view the data type in the TwinCAT type system under **SYSTEM > Type System**.

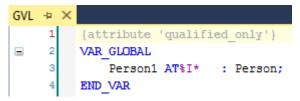

To distinguish the data type from other data types you can add a prefix in the settings of the OPC UA Client.

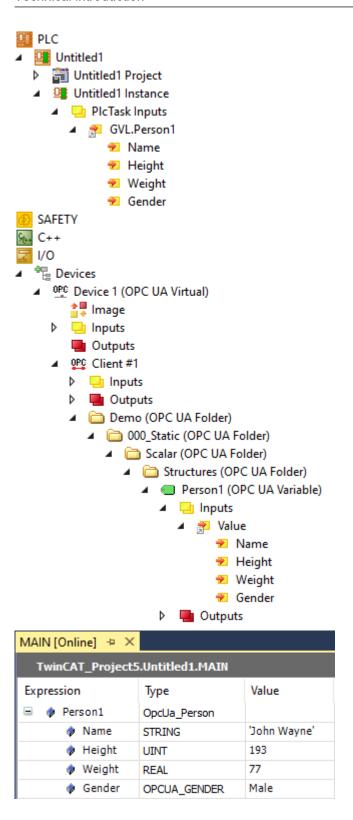

#### Mapping a StructuredType

Since every StructuredType is added to the TwinCAT type system, the mapping of the variables is simple. Create an input/output variable of this data type and subsequently a mapping.

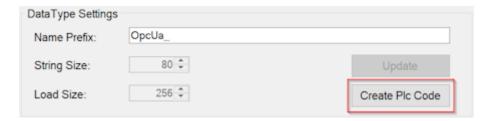

# 4.10 Code generation

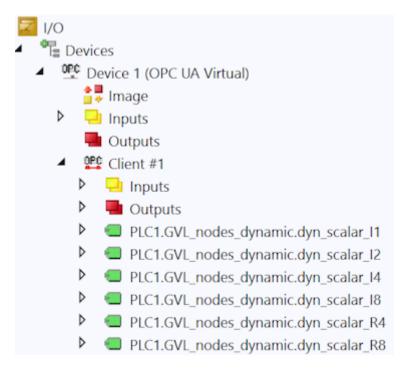

With the help of the automatic code generation, PLC variables for the OPC UA nodes configured in the I/O process image can be generated quickly and easily and linked to them automatically. This function is available in the configuration dialog of the I/O client via the button **Create Plc Code**. This function requires an existing PLC project in the current solution.

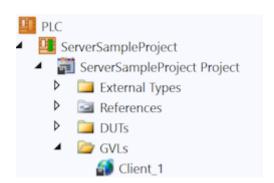

After calling this function, a new **G**lobal **V**ariable **L**ist (GVL) with the name of the I/O client is created in the PLC project. Subsequently, all OPC UA nodes are read and corresponding variables are created in the GVL. Each variable receives the TcLinkTo attribute for an automatic linking with the corresponding variable from the I/O process image.

Example: In the I/O part of TwinCAT XAE a TwinCAT OPC UA I/O client with the name "Client 1" was created, to which various OPC UA nodes from a server were added.

After calling the code generation, a new GVL with the name "Client\_1" was now created in the (already existing) PLC project. This then contains corresponding PLC variables for the individual nodes, which were then automatically linked via the TcLinkTo attribute.

#### VAR GLOBAL

```
{attribute 'TcLinkTo' := 'TIID^Device 1 (OPC UA Virtual)^Client #1^PLC1.GVL_nodes_dynamic.dyn_scalar_I1^Inputs^Value'}
PLC1_GVL_nodes_dynamic_dyn_scalar_I1_Client_1_Device_1 AT %1* : SINT;

{attribute 'TcLinkTo' := 'TIID^Device 1 (OPC UA Virtual)^Client #1^PLC1.GVL_nodes_dynamic.dyn_scalar_I2^Inputs^Value'}
PLC1_GVL_nodes_dynamic_dyn_scalar_I2_Client_1_Device_1 AT %1* : INT;

{attribute 'TcLinkTo' := 'TIID^Device 1 (OPC UA Virtual)^Client #1^PLC1.GVL_nodes_dynamic.dyn_scalar_I4^Inputs^Value'}
PLC1_GVL_nodes_dynamic_dyn_scalar_I4_Client_1_Device_1 AT %1* : DINT;

{attribute 'TcLinkTo' := 'TIID^Device 1 (OPC UA Virtual)^Client #1^PLC1.GVL_nodes_dynamic.dyn_scalar_I8^Inputs^Value'}
PLC1_GVL_nodes_dynamic_dyn_scalar_I8_Client_1_Device_1 AT %1* : LINT;

{attribute 'TcLinkTo' := 'TIID^Device 1 (OPC UA Virtual)^Client #1^PLC1.GVL_nodes_dynamic.dyn_scalar_R4^Inputs^Value'}
PLC1_GVL_nodes_dynamic_dyn_scalar_R4_Client_1_Device_1 AT %1* : REAL;

{attribute 'TcLinkTo' := 'TIID^Device 1 (OPC UA Virtual)^Client #1^PLC1.GVL_nodes_dynamic.dyn_scalar_R8^Inputs^Value'}
PLC1_GVL_nodes_dynamic_dyn_scalar_R8_Client_1_Device_1 AT %1* : LREAL;

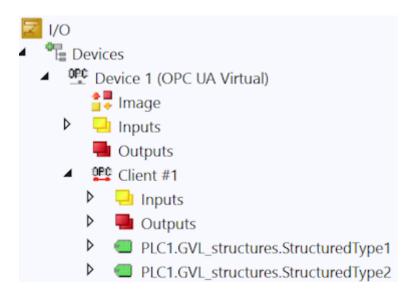

END VAR
```

In addition, the control variables from the respective I/O client are also created and linked as variables in the GVL (not shown in the screenshot above).

#### Code generation for structures

An OPC UA node, which represents a so-called StructuredDataType, is also considered by the code generation and a corresponding variable is created in the GVL. Since the StructuredDataType was created as a native data type in the TwinCAT type system, it can be handled like a normal structure.

**Example:** Two StructuredDataTypes from a server were added to the process image of the I/O client. The data types of the StructuredDataTypes on the server are ST\_Complex1 and ST\_Complex2 (not visible in the screenshot below).

The code generation has now created a corresponding GVL with two variables from the respective automatically generated TwinCAT data type, which corresponds to the respective StructuredDataType.

```
VAR_GLOBAL
```

```
{attribute 'TcLinkTo' := 'TIID^Device 1 (OPC UA Virtual)^Client #1^PLC1.GVL_structures.StructuredType1^Inputs^Value'}
PLC1_GVL_structures_StructuredType1_Client_1_Device_1 AT %I* : OpcUa_ST_Complex_1;

{attribute 'TcLinkTo' := 'TIID^Device 1 (OPC UA Virtual)^Client #1^PLC1.GVL_structures.StructuredType2^Inputs^Value'}
PLC1_GVL_structures_StructuredType2_Client_1_Device_1 AT %I* : OpcUa_ST_Complex_2;

END VAR
```

#### Code generation for methods

An OPC UA method has input and output parameters which are passed to or returned from the method accordingly. Furthermore, a method is a self-contained call; it must be explicitly started by the client. This methodology is mapped accordingly in the process image of the I/O client at the method and is also taken into account during code generation. For a method, unlike normal variables or structures, a separate function block is created, which is then referenced in the GVL.

**Example:** Two methods from a server have been added to the process image of the I/O client.

```
I/O

Devices

Device 1 (OPC UA Virtual)

Image

Inputs
Outputs

Client #1

Inputs
Outputs

PLC1.GVL_methods.Mathematics.Add2

PLC1.GVL_methods.Mathematics.Sub2
```

The code generation has now created a corresponding GVL, as well as two function blocks, which represent the input/output and control variables of the respective method.

```
VAR_GLOBAL

# 4.11 PLCopen function blocks

The TwinCAT OPC UA Client offers several options for communicating directly with one or more OPC UA servers from the control logic. On the one hand, there is a TwinCAT I/O device, which offers a simple, mapping-based interface. On the other hand, PLCopen provides standardized function blocks that can be used to initiate a connection with an OPC UA server directly from the PLC logic. The handling of these function blocks is described in more detail below. This article consists of the following sections:

- Workflow
- Determination of the communication parameters
- · Establishing a connection
- · Reading variables
- · Writing variables
- · Calling methods

#### Workflow

The general workflow when using the PLCopen function blocks can be schematically represented as follows:

In the preparation phase, the communication parameters are set up and a connection to the server is established. The desired function is then executed (read, write, method calls), followed by disconnection of the communication connection.

#### **Determination of the communication parameters**

In general a graphic OPC UA Client is used to determine the attributes of a node or methods that have to be used together with the PLC function blocks, e.g.:

- NodeID
- · NamespaceIndex and corresponding NamespaceURI
- DataType
- MethodNodeID and ObjectNodeID

The following documentation uses the generic OPC UA Client UA Expert as an example. This client can be purchased via the Unified Automation web pages: <a href="https://www.unified-automation.com">www.unified-automation.com</a>.

Nodes are characterized by the following three attributes, which form the so-called NodeID:

- NamespaceIndex: The namespace in which the node is located, such as the PLC runtime.
- · Identifier: Unique identifier of the node within its namespace
- · IdentifierType: Type of node: String, Guid and Numeric

These attributes represent the so-called *NodeID* - the representation of a node on an OPC UA server - and are required by many subsequent function blocks.

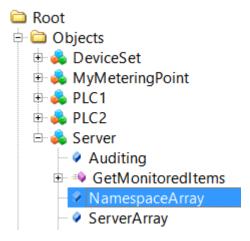

With the help of the UA Expert software you can simply determine the attributes of a node by establishing a connection to the OPC UA server and browsing to the desired node. The attributes are then visible in the Attributes panel, e.g.

- Nodeld	Nodeld
NamespaceIndex	5
IdentifierType	String
Identifier	MAIN.nCounter

According to the OPC UA specification, the NamespaceIndex can be a dynamically generated value. Therefore, OPC UA Clients must always use the corresponding namespace URI to resolve the NamespaceIndex before a node handle is detected.

Use the function block <u>UA\_GetNamespaceIndex</u> [• 68] to obtain the NamespaceIndex for a NamespaceURI. The NamespaceURI required for this can be determined with the help of UA Expert by establishing a connection to the OPC UA server and browsing to the NamespaceArray node.

This node contains information about all namespaces registered on the OPC UA Server. The corresponding namespace URIs are visible in the Attributes panel, for example:

₽ Value	
SourceTimestamp	16.02.2015 08:56:06.350
ServerTimestamp	16.02.2015 09:31:01.945
SourcePicoseconds	0
ServerPicoseconds	0
□ Value	String Array[9]
···· [O]	http://opcfoundation.org/UA/
[1]	urn:SvenG-NB04:BeckhoffAutomation:TcOpcUaServer:1
··· [2]	http://opcfoundation.org/UA/DI/
···· [3]	http://PLCopen.org/OpcUa/IEC61131-3/
···· [4]	urn://SVENG-NB04/BeckhoffAutomation/Ua/Typesystem
···· [5]	urn://SVENG-NB04/BeckhoffAutomation/Ua/PLC1
···· [6]	urn://SVENG-NB04/BeckhoffAutomation/Ua/PLC2
···· [7]	http://www.opcfoundation.org/Energy/DataAcquisition/
[8]	http://Beckhoff.com/TwinCAT/TF6100/Server/Configuration

The section above shows an example of a NodeID in which the namespace index is 5. According to the NamespaceArray shown in the figure, the corresponding NamespaceURI is urn://SVENG-NB04/BeckhoffAutomation/Ua/PLC1. This URI can now be used for the function block UA\_GetNamespaceIndex. The OPC UA Server ensures that the URI always remains the same, even after a restart.

# •

#### **Observe the correct NamespaceIndex**

As the NamespaceIndex shown can change, the NamespaceURI should always be used in combination with the function block UA\_GetNamespaceIndex for later use with other function blocks, e.g. UA Read [ > 80], UA Write [ > 82], to resolve the correct NamespaceIndex.

#### **DataType**

The data type of a node is required in order to see which PLC data type needs to be used in order to assign a read value or write it to a node. With the help of UA Expert you can simply determine the data type of a node by establishing a connection to the OPC UA Server and browsing to the desired node. The data type is then visible in the Attributes panel, for example:

□ DataType	Int16
NamespaceIndex	0
IdentifierType	Numeric
Identifier	4

In this case the data type (DataType) is "Int16". This must be assigned to an equivalent data type in the PLC, e.g. "INT".

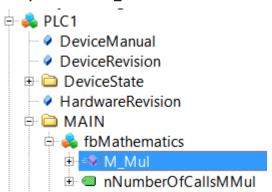

#### MethodNodelD and ObjectNodelD

When calling methods from the OPC UA namespace, two identifiers are required if the method handle is get using the function block <u>UA MethodGetHandle</u> [• 74]:

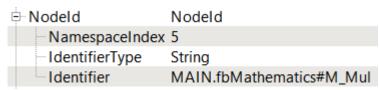

- ObjectNodeID: Identifies the UA object that contains the method.
- · MethodNodeID: Identifies the method itself.

With the help of UA Expert you can simply determine both NodelDs by establishing a connection to the OPC UA server and browsing to the desired method or the desired UA object that contains the method.

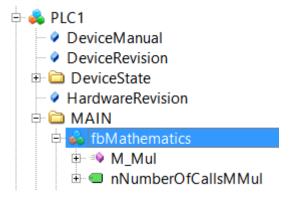

#### Sample Method M\_Mul:

The method identifier is then visible in the Attributes panel.

#### Sample Object fbMathematics:

The object identifier is then visible in the Attributes panel.

- Nodeld	Nodeld
NamespaceIndex	5
- IdentifierType	String
Identifier	MAIN.fbMathematics

#### Establishing a connection

The following section describes how you use the function block TcX\_PLCopen\_OpcUa to establish a connection to a local or remote OPC UA server. This connection can then be used to call other functions, such as read or write nodes, or call methods.

The following function blocks are required to establish a connection to an OPC UA server and subsequently interrupt the session: <u>UA Connect [ 65]</u>, <u>UA Disconnect [ 67]</u>.

First read the section How to determine communication parameters to better understand certain UA functionalities (e.g. how to determine Nodeldentifiers).

The function block UA\_Connect requires the following information in order to be able to establish a connection to a local or remote OPC UA server:

- · Server URL
- · Session Connect Information

The Server URL basically consists of a prefix, a host name and a port. The prefix describes the OPC UA transport protocol that should be used for the connection, e.g. "opc.tcp://" for a binary TCP connection (default). The host name or IP address part describes the address information of the OPC UA target server, e.g. "192.168.1.1" or "CX-12345". The port number is the target port of the OPC UA Server, e.g. "4840". The Server URL can then look like this: opc.tcp://CX-12345:4840.

#### **Declaration:**

```
(* Declarations for UA_Connect *)
fbUA_Connect: UA_Connect;
SessionConnectInfo: ST_UASessionConnectInfo;
nConnectionHdl: DWORD;

(* Declarations for UA_Disconnect *)
fbUA_Disconnect: UA_Disconnect;

(* Declarations for state machine and output handling *)
iState: INT;
bDone: BOOL;
bBusy: BOOL;
bError: BOOL;
nErrorID: DWORD;
```

#### Implementation:

```
CASE iState OF
      bError := FALSE;
      nErrorID := 0;
      SessionConnectInfo.tConnectTimeout := T#1M;
      SessionConnectInfo.tSessionTimeout := T#1M;
      SessionConnectInfo.sApplicationName := '';
      SessionConnectInfo.sApplicationUri := '';
      SessionConnectInfo.eSecurityMode := eUASecurityMsgMode None;
      SessionConnectInfo.eSecurityPolicyUri := eUASecurityPolicy_None;
      SessionConnectInfo.eTransportProfileUri := eUATransportProfileUri UATcp;
      stNodeAddInfo.nIndexRangeCount := nIndexRangeCount;
      stNodeAddInfo.stIndexRange := stIndexRange;
      iState := iState + 1;
  1:
    fbUA_Connect(
      Execute := TRUE,
      ServerURL := 'opc.tcp://192.168.1.1:4840',
      SessionConnectInfo := SessionConnectInfo,
      Timeout := T#5S,
```

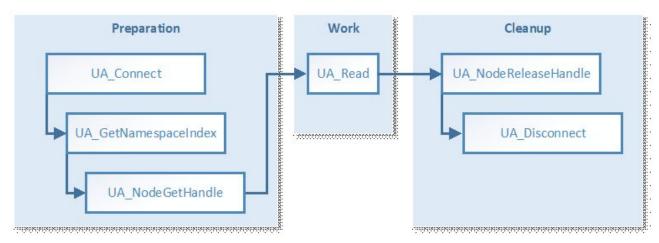

```
ConnectionHdl => nConnectionHdl);
    IF NOT fbUA Connect.Busy THEN
      fbUA Connect (Execute := FALSE);
      IF NOT fbUA_Connect.Error THEN
        iState := iState + 1;
      ELSE
        bError := TRUE;
        nErrorID := fbUA Connect.ErrorID;
        nConnectionHdl := 0;
        iState := 0;
      END IF
    END IF
    fbUA Disconnect(
      Execute := TRUE,
      ConnectionHdl := nConnectionHdl);
    IF NOT fbUA Disconnect.Busy THEN
      fbUA Disconnect (Execute := FALSE);
      \operatorname{\overline{IF}} NOT fbUA Disconnect.Error THEN
        iState := 0;
      ELSE
        bError := TRUE;
        nErrorID := fbUA_Disconnect.ErrorID;
        iState := 0;
        nConnectionHdl := 0;
      END IF
    END IF
END CASE
```

#### Reading variables

The following section describes how to use the function blocks TcX\_PLCopen\_OpcUa to read an OPC UA node from a local or remote OPC UA server. The following function blocks are required to establish a connection to an OPC UA server, read UA nodes and later interrupt the session: <u>UA Connect [\* 65]</u>, <u>UA GetNamespaceIndex [\* 68]</u>, <u>UA NodeGetHandle [\* 76]</u>, <u>UA Read [\* 80]</u>, <u>UA NodeReleaseHandle [\* 78]</u>, <u>UA Disconnect [\* 67]</u>.

The schematic workflow of each TwinCAT OPC UA Client can be categorized into three different phases: Preparation, Work and Cleanup.

The use case described in this section can be visualized as follows:

- The function block UA\_Connect requires the following information to establish a connection to a local or remote OPC UA Server (see also How to establish a connection):
  - Server URL
  - Session Connect Information
- The function block UA\_GetNamespaceIndex requires a Connection Handle (from UA\_Connect) and a NamespaceURI for resolution to a NamespaceIndex, which is later used by UA\_NodeGetHandle to capture a node handle (see also How to determine communication parameters).

- The function block UA\_NodeGetHandle requires a Connection Handle (from UA\_Connect) and NodeID (from ST\_UANodeID) to capture a node handle (see also How to determine communication parameters).
- The function block UA\_Read requires a connection handle (from UA\_Connect), a node handle (from UA\_NodeGetHandle) and a pointer to the target variable (where the read value is to be saved). Make sure that the target variable has the correct data type (see also How to determine communication parameters).
- The function block UA\_NodeReleaseHandle requires a connection handle (from UA\_Connect) and a node handle (from UA\_NodeGetHandle).

#### **Declaration:**

```
(* Declarations for UA_GetNamespaceIndex *)
fbUA GetNamespaceIndex: UA GetNamespaceIndex;
nNamespaceIndex : UINT:
(* Declarations for UA NodeGetHandle *)
fbUA NodeGetHandle : UA NodeGetHandle;
NodeID: ST UANodeID;
nNodeHdl : DWORD;
(* Declarations for UA Read *)
fbUA Read : UA Read;
stIndexRange : ARRAY [1..nMaxIndexRange] OF ST UAIndexRange;
nIndexRangeCount : UINT;
stNodeAddInfo : ST UANodeAdditionalInfo;
sNodeIdentifier : STRING (MAX STRING LENGTH) := 'MAIN.nCounter';
nReadData : INT;
cbDataRead : UDINT;
(* Declarations for UA NodeReleaseHandle *)
fbUA_NodeReleaseHandle : UA_NodeReleaseHandle;
```

#### Implementation:

```
CASE iState OF
 0:
    [...]
 2: (* GetNS Index *)
    fbUA GetNamespaceIndex(
      Execute := TRUE,
      ConnectionHdl := nConnectionHdl,
      NamespaceUri := sNamespaceUri,
      NamespaceIndex => nNamespaceIndex
    IF NOT fbUA GetNamespaceIndex.Busy THEN
      fbUA GetNamespaceIndex(Execute := FALSE);
      {\tt IF\ NOT\ fbUA\_GetNamespaceIndex.Error\ THEN}
        iState := iState + 1;
      ELSE
       bError := TRUE;
        nErrorID := fbUA_GetNamespaceIndex.ErrorID;
        iState := 6;
      END IF
    END IF
  3: (* UA NodeGetHandle *)

     stNodeAddInfo := stNodeAddInfo,
     pVariable := ADR(nReadData));
    IF NOT fbUA_Read.Busy THEN
      fbUA Read( Execute := FALSE, cbData R => cbDataRead);
      IF NOT fbUA Read. Error THEN
        iState := iState + 1;
     ELSE
       bError := TRUE;
       nErrorID := fbUA Read.ErrorID;
        iState := 6;
     END IF
    END IF
 5: (* Release Node Handle *)
    fbUA NodeReleaseHandle(
     Execute := TRUE,
      ConnectionHdl := nConnectionHdl,
      NodeHdl := nNodeHdl);
    IF NOT fbUA NodeReleaseHandle.Busy THEN
      fbUA NodeReleaseHandle(Execute := FALSE);
      IF NOT fbUA_NodeReleaseHandle.Error THEN
        iState := iState + 1;
      ELSE
       bError := TRUE;
        nErrorID := fbUA_NodeReleaseHandle.ErrorID;
        iState := 6;
      END IF
    END_IF
    [...]
END CASE
```

#### Writing variables

The following section describes how you use the function block TcX\_PLCopen\_OpcUa to write values in an OPC UA node from a local or remote OPC UA server. The following function blocks are required to establish a connection to an OPC UA server, write UA nodes and subsequently interrupt the session: <u>UA\_Connect [\bigsigma 65]</u>, <u>UA\_GetNamespaceIndex [\bigsigma 68]</u>, <u>UA\_NodeGetHandle [\bigsigma 76]</u>, <u>UA\_Write [\bigsigma 82]</u>, <u>UA\_NodeReleaseHandle [\bigsigma 78]</u>, <u>UA\_Disconnect [\bigsigma 67]</u>.

The schematic workflow of each TwinCAT OPC UA Client can be categorized into three different phases: Preparation, Work and Cleanup.

The use case described in this section can be visualized as follows:

- The function block UA\_Connect requires the following information in order to be able to establish a connection to a local or remote OPC UA server (see also How to establish a connection):
  - Server URL

- Session Connect Information
- The function block UA\_GetNamespaceIndex requires a Connection Handle (from UA\_Connect) and a NamespaceURI for resolution to a NamespaceIndex, which is later used by UA\_NodeGetHandle to capture a node handle (see also How to determine communication parameters).
- The function block UA\_NodeGetHandle requires a Connection Handle (from UA\_Connect) and NodeID (from ST\_UANodeID) to capture a node handle (see also How to determine communication parameters).
- The function block UA\_Write requires a connection handle (from UA\_Connect), a node handle (from UA\_NodeGetHandle) and a pointer to a variable containing the value that is to be written. Make sure that the target variable has the correct data type (see also How to determine communication parameters).
- The function block UA\_NodeReleaseHandle requires a connection handle (from UA\_Connect) and a node handle (from UA\_NodeGetHandle).

#### **Declaration:**

```
(* Declarations for UA GetNamespaceIndex *)
fbUA GetNamespaceIndex : UA GetNamespaceIndex;
nNamespaceIndex : UINT;
(* Declarations for UA NodeGetHandle *)
fbUA NodeGetHandle : UA NodeGetHandle;

       pVariable := ADR(nWriteData));
      IF NOT fbUA_Write.Error THEN
       iState := iState + 1;
       bError := TRUE;
        nErrorID := fbUA Write.ErrorID;
        iState := 6;
     END IF
    END IF
 5: (* Release Node Handle *)
    fbUA NodeReleaseHandle(
     Execute := TRUE,
     ConnectionHdl := nConnectionHdl.
     NodeHdl := nNodeHdl);
    IF NOT fbUA NodeReleaseHandle.Busy THEN
      fbUA NodeReleaseHandle (Execute := FALSE);
      IF NOT fbUA_NodeReleaseHandle.Error THEN
        iState := iState + 1;
      ELSE
        bError := TRUE;
       nErrorID := fbUA NodeReleaseHandle.ErrorID;
       iState := 6;
     END IF
    END IF
 6:
    [...]
END CASE
```

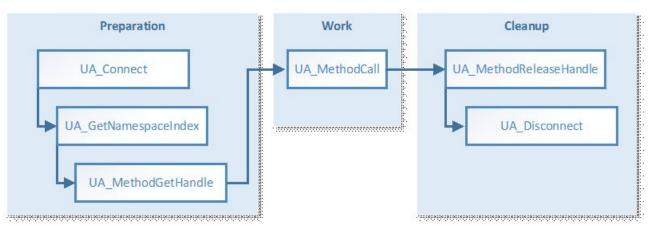

#### **Calling methods**

The following section describes how you use the function block TcX\_PLCopen\_OpcUa to call methods on a local or remote OPC UA server. The following function blocks are required to connect to an OPC UA server, call UA methods, and subsequently interrupt the session: <u>UA Connect [\beta 65]</u>, <u>UA GetNamespaceIndex [\beta 68]</u>, <u>UA MethodGetHandle [\beta 74]</u>, <u>UA MethodCall [\beta 71]</u>, <u>UA MethodReleaseHandle [\beta 75]</u>, <u>UA Disconnect [\beta 67]</u>.

The schematic workflow of each TwinCAT OPC UA Client can be categorized into three different phases: Preparation, Work and Cleanup.

The use case described in this section can be visualized as follows:

- The function block UA\_Connect requires the following information in order to be able to establish a connection to a local or remote OPC UA server (see also How to establish a connection):
  - Server URL
  - Session Connect Information
- The function block UA\_GetNamespaceIndex requires a Connection Handle (from UA\_Connect) and a NamespaceURI for resolution to a NamespaceIndex, which is later used by UA\_NodeGetHandle to capture a node handle (see also How to determine communication parameters).
- The function block UA\_MethodGetHandle requires a connection handle (from UA\_Connect), an ObjectNodeID and a MethodNodeID to capture a method handle (see also How to determine communication parameters).
- The function block UA\_MethodCall requires a connection handle (from UA\_Connect), a method handle (from UA\_MethodGetHandle) and information about the input and output arguments of the method that is to be called. Information about the input arguments is represented by the input parameters plnputArgInfo and plnputArgData of UA\_MethodCall. Information about the output parameters is represented by the pOutputArgInfo and pOutputArgData input parameters of UA\_MethodCall. The input parameter pOutputArgInfoAndData then represents a pointer to a structure containing the results of the method call, including all output parameters. The following code snippet calculates and creates the plnputArgInfo and plnputArgData parameters in the M\_Init method.
- The function block UA\_NodeReleaseHandle requires a connection handle (from UA\_Connect) and a method handle (from UA\_MethodGetHandle).

#### M\_Init initialization method of the function block containing the UA method call:

```
MEMSET(ADR(nInputData), 0, SIZEOF(nInputData));
nArg := 1;
(******* Input parameter 1 *******)
InputArguments[nArg].DataType := eUAType Int16;
InputArguments[nArg].ValueRank := -1; (* Scalar = -1 or Array *)
 InputArguments[nArg]. ArrayDimensions[1] := 0; (* Number of Dimension in case its an array *) \\ InputArguments[nArg].nLenData := SIZEOF(numberIn1); (* Length if its a STRING *) 
IF nOffset + SIZEOF(numberIn1) > nInputArgSize THEN
  bInputDataError := TRUE;
ELSE
  MEMCPY(ADR(nInputData)+nOffset,ADR(numberIn1),SIZEOF(numberIn1)); (* VALUE in BYTES FORM *)
  nOffset := nOffset + SIZEOF(numberIn1);
END IF
nArg := nArg + 1;
(******* Input parameter 2 *******)
InputArguments[nArg].DataType := eUAType Int16;
InputArguments[nArg].ValueRank := -1; (* Scalar = -1 or Array *)
InputArguments[nArg].ArrayDimensions[1] := 0; (* Number of Dimension in case its an array *)
InputArguments[nArg].nLenData := SIZEOF(numberIn2); (* Length if its a STRING *)
IF nOffset + SIZEOF(numberIn2) > nInputArgSize THEN
  bInputDataError := TRUE;
  RETURN;
  MEMCPY(ADR(nInputData)+nOffset,ADR(numberIn2),SIZEOF(numberIn2));(* VALUE in BYTES FORM *)
  nOffset := nOffset + SIZEOF(numberIn2);
END IF
cbWriteData := nOffset;
```

#### **Declaration:**

```
(* Declarations for UA GetNamespaceIndex *)
fbUA GetNamespaceIndex: UA GetNamespaceIndex;
nNamespaceIndex : UINT;
(* Declarations for UA_MethodGetHandle *)
fbUA MethodGetHandle: UA MethodGetHandle;
ObjectNodeID: ST UANodeID;
MethodNodeID: ST UANodeID;
nMethodHdl: DWORD;
(* Declarations for UA MethodCall *)
fbUA MethodCall: UA MethodCall;
sObjectNodeIdIdentifier : STRING(MAX_STRING_LENGTH) := 'MAIN.fbMathematics';
sMethodNodeIdIdentifier : STRING (MAX STRING LENGTH) := 'MAIN.fbMathematics#M Mul';
nAdrWriteData: PVOID;

# 5 PLC API

# 5.1 Tc2\_OpcUa

## 5.1.1 Data types

## 5.1.1.1 ST\_OpcUAServerInfo

ST\_OpcUAServerInfo contains session information of a TwinCAT OPC UA Server.

#### **Syntax**

```
TYPE ST_OpcUAServerInfo:
STRUCT

nReserved: UDINT;
nCummulatedSessionCount : UDINT;
nCurrentSessionCount : UDINT;
nRejectedSessionCount : UDINT;
nSecurityRejectedSessionCount : UDINT;
nSessionTimeoutCount : UDINT;
nCurrentSubscriptionCount : UDINT;
nRejectedRequestCount : UDINT;
nRejectedRequestCount : UDINT;
nSecurityRejectedRequestCount : UDINT;
```

#### **Parameter**

Name	Туре	Description
nReserved	UDINT	Placeholder.
nCummulatedSessionCount	UDINT	Total number of client sessions since the server was started.
nCurrentSessionCount	UDINT	Total number of current client sessions.
nRejectedSessionCount	UDINT	Total number of sessions rejected by the server.
nSecurityRejectedSessionCount	UDINT	Total number of sessions rejected by the server for security reasons (example: incorrect combination of user name and password).
nSessionTimeoutCount	UDINT	Total number of sessions that had a timeout.
nCurrentSubscriptionCount	UDINT	Total number of current subscriptions in the server.
nRejectedRequestCount	UDINT	Total number of failed requests.
nSecurityRejectedRequestCount	UDINT	Total number of failed requests for security reasons.

## 5.1.1.2 E\_OpcUAServerOption

E\_OpcUAServerOption determines which command is to be sent to the TwinCAT OPC UA Server.

## Syntax

#### **Parameter**

Name	Description
eOPCUAServerOption_Non e	Initial state of the enumeration.
eOPCUAServerOption_Res tart	This option triggers a restart of the OPC UA interface of the server.
eOPCUAServerOption_Shu tdown	This option triggers the shutdown of the OPC UA interface of the server. As the restart option above works via OPC UA, it is no longer available after using this option until a complete server restart.
eOPCUAServerOption_RefreshCfg	This option currently has no function.
eOPCUAServerOption_ServerInfo	This option queries the server information contained in <u>ST_OpcUAServerInfo</u> [▶ <u>46</u> ].

## 5.1.1.3 E\_OpcUAServerStatus

E OpcUAServerStatus represents the runtime status of a TwinCAT OPC UA Server.

#### **Syntax**

```
TYPE E_OpcUAServerStatus
(
    eOPCUAServerStatus_None,
    eOPCUAServerStatus_Alive,
    eOPCUAServerStatus_NotResponding
);
END_TYPE
```

#### **Parameter**

Name	Description
eOPCUAServerStatus_None	Initial state of the enumeration.
eOPCUAServerStatus_Alive	The ADS interface of the TwinCAT OPC UA Server is accessible.
eOPCUAServerStatus_NotResponding	The ADS interface of the TwinCAT OPC UA Server is not accessible.

## 5.1.2 Function blocks

## 5.1.2.1 FB\_OpcUAServer

```
FB_OpcUAServer

sNetId T_AmsNetId ST_OpcUAServerInfo stOpcUAServerInfo
bExecute BOOL BOOL bBusy
eOpcUAServerOption E_OpcUAServerOption
tTimeout TIME

FB_OpcUAServerInfo StOpcUAServerInfo Stopc
```

The function block enables status information to be read out and a TwinCAT OPC UA Server to be restarted.

#### **Syntax**

#### Definition:

```
VAR_OUTPUT
stOpcUAServerInfo: ST_OpcUAServerInfo;
bBusy: BOOL;
bError: BOOL;
nErrorId: UDINT;
END_VAR
```

#### Inputs

Name	Туре	Description	
sNetId	T_AmsNetId	AmsNetId of the system on which the TwinCAT OPC UA Server runs.	
bExecute	BOOL	A rising edge activates processing of the function block.	
eOpcUAServerOption	E OpcUAServerOption  [▶ 46]	Specifies the operation to be performed.	
tTimeout	TIME	ADS Timeout	

#### Outputs

Name	Туре	Description
stOpcUAServerInfo	ST OpcUAServerInfo [▶ 46]	Contains status information from the server when ServerInfo is selected at the eOpcUAServerOption input.
bBusy	BOOL	TRUE as long as processing of the function block is in progress.
bError	BOOL	Becomes TRUE as soon as an error situation occurs.
nErrorld	UDINT	Contains the error code when an error (bError) occurs.

## 5.1.2.2 FB\_OpcUAServerGetStatus

The function block enables the current status (Running, NotResponding) of a TwinCAT OPC UA Server to be read. It should be noted at this point that this function block deals with the ADS interface of the OPC UA Server. If the OPC UA Server is restarted or shut down, the ADS interface of the server remains accessible. The ADS interface can only be closed by terminating the server process.

#### **Syntax**

#### Definition:

```
FUNCTION_BLOCK FB_OpcUAServerGetStatus

VAR_INPUT

SNetId : T_AmsNetId;
bGetStatus : BOOL;
tTimeout : TIME;

END_VAR

VAR_OUTPUT

eOPCUAServerStatus : E_OPCUAServerStatus;
bDone : BOOL;
bBusy : BOOL;
bError : BOOL;
nErrorId : UDINT;

END_VAR
```

### Inputs

Name	Туре	Description
sNetId	T_AmsNetId	AmsNetId of the system on which the TwinCAT OPC UA Server runs.
bGetStatus	BOOL	A rising edge activates processing of the function block.
tTimeout	TIME	ADS Timeout

## Outputs

Name	Туре	Description
eOPCUAServerStatu	E OpcUAServerStatus	Contains status information about the server.
S	[ <u>\( 47)</u>	
bDone	BOOL	TRUE when processing of the function block is complete.
bBusy	BOOL	TRUE as long as processing of the function block is in
		progress.
bError	BOOL	Becomes TRUE as soon as an error situation occurs.
nErrorld	UDINT	Contains the error code when an error (bError) occurs.

# 5.2 Tc3\_PLCopen\_OpcUa

## 5.2.1 Data types

## 5.2.1.1 E\_UAAttributeID

#### **Syntax**

Name	Description
NodelD	OPC UA NodeID
NodeClass	OPC UA NodeClass
BrowseName	OPC UA BrowseName
DisplayName	OPC UA DisplayName
Description	OPC UA Description
WriteMask	OPC UA WriteMask
UserWriteMask	OPC UA UserWriteMask
IsAbstract	OPC UA IsAbstract
Symmetric	OPC UA Symmetric
InverseName	OPC UA InverseName
ContainsNoLoops	OPC UA ContainsNoLoops
EventNotifier	OPC UA EventNotifier
Value	OPC UA Value
DataType	OPC UA DataType
ValueRank	OPC UA ValueRank
ArrayDimensions	OPC UA ArrayDimensions

### Requirements

Development environment	Target platform	PLC libraries to include
TwinCAT 3.1	Win32, Win64, CE-X86, CE-ARM	Tc3_PLCopen_OpcUa

## 5.2.1.2 E\_UABrowseDirection

#### **Syntax**

```
TYPE E_UABrowseDirection:
(
    eUABD_Forward := 0,
    eUABD_Inverse := 1,
    eUABD_Both := 2
) DINT;
END_TYPE
```

#### **Values**

Name	Description
eUABD_Forward	Forward references
eUABD_Inverse	Inverse references
eUABD_Both	Forward and inverse references

#### Requirements

Development environment	Target platform	PLC libraries to include
TwinCAT 3.1	Win32, Win64, CE-X86, CE-ARM	Tc3_PLCopen_OpcUa

## 5.2.1.3 E\_UABrowseResultMask

### **Syntax**

```
TYPE E_UABrowseResultMask:
   (
    eUABRM_ReferenceTypeId := 1,
    eUABRM_IsForward := 2,
    eUABRM_ReferenceTypeInfo := 3,
```

```
eUABRM_NodeClass := 4,
eUABRM_BrowseName := 8,
eUABRM_DisplayName := 16,
eUABRM_TypeDefinition := 32,
eUABRM_TargetInfo := 60,
eUABRM_All := 63
) DINT;
END_TYPE
```

Name	Description
eUABRM_ReferenceTypeId	ReferenceTypeId
eUABRM_IsForward	IsForward
eUABRM_ReferenceTypeInfo	ReferenceTypeInfo
eUABRM_NodeClass	NodeClass
eUABRM_BrowseName	BrowseName
eUABRM_DisplayName	DisplayName
eUABRM_TypeDefinition	TypeDefinition
eUABRM_TargetInfo	TargetInfo
eUABRM_AII	All

#### Requirements

Development environment	Target platform	PLC libraries to include
TwinCAT 3.1	Win32, Win64, CE-X86, CE-ARM	Tc3_PLCopen_OpcUa

## 5.2.1.4 E\_UAConnectionStatus

#### **Syntax**

```
TYPE E_UAConnectionStatus:
(
          Connected := 0
          ConnectionError := 1,
          Shutdown := 2
) DINT;
END_TYPE
```

#### **Values**

Name	Description
Connected	The connection has been established.
ConnectionError	An error occurred while establishing the connection.
Shutdown	The connection was disconnected.

#### Requirements

Development environment	Target platform	PLC libraries to include
TwinCAT 3.1	Win32, Win64, CE-X86, CE-ARM	Tc3_PLCopen_OpcUa

PLC library	Required version
Tc3_PLCopen_OpcUa	>= 3.2.11.0

## 5.2.1.5 E\_UADataType

#### **Syntax**

```
TYPE E_UADataType:
(
    eUAType_Undefinied := -1,
```

Name	Description
eUAType_Undefinied	Undefinied
eUAType_Null	Zero
eUAType_Boolean	Boolean
eUAType_SByte	SByte
eUAType_Byte	Byte
eUAType_Int16	Int16
eUAType_UInt16	UInt16
eUAType_Int32	Int32
eUAType_UInt32	UInt32
eUAType_Int64	Int64
eUAType_UInt64	UInt64
eUAType_Float	Float
eUAType_Double	Double
eUAType_String	String
eUAType_DateTime	DateTime
eUAType_Guid	Guid
eUAType_ByteString	ByteString
eUAType_XmlElement	XmlElement
eUAType_NodeId	Nodeld
eUAType_ExpandedNodeId	ExpandedNodeld
eUAType_StatusCode	StatusCode
eUAType_QualifiedName	QualifiedName
eUAType_LocalizedText	LocalizedText
eUAType_ExtensionObject	ExtensionObject
eUAType_DataValue	DataValue
eUAType_Variant	Variant
eUAType_DiagnosticInfo	DiagnosticInfo

#### Requirements

Development environment	Target platform	PLC libraries to include
TwinCAT 3.1	Win32, Win64, CE-X86, CE-ARM	Tc3_PLCopen_OpcUa

## 5.2.1.6 E\_UAldentifierType

#### **Syntax**

```
TYPE E_UAldentifierType:
(
    eUAldentifierType_String := 1,
    eUAldentifierType_Numeric := 2,
    eUAldentifierType_GUID := 3,
    eUAldentifierType_Opaque := 4
) DINT;
END_TYPE
```

#### **Values**

Name	Description
eUAldentifierType_String	String
eUAldentifierType_Numeric	Numeric
eUAldentifierType_GUID	GUID
eUAldentifierType_Opaque	Opaque

#### Requirements

Development environment	Target platform	PLC libraries to include
TwinCAT 3.1	Win32, Win64, CE-X86, CE-ARM	Tc3_PLCopen_OpcUa

## 5.2.1.7 E\_UANodeClassMask

#### **Syntax**

```
TYPE E_UANodeClassMask:
(
    eUANCM_Unspecified := 0,
    eUANCM_Object := 1,
    eUANCM_Variable := 2,
    eUANCM_Method := 4,
    eUANCM_ObjectType := 8,
    eUANCM_VariableType := 16,
    eUANCM_VariableType := 16,
    eUANCM_ReferenceType := 32,
    eUANCM_DataType := 64,
    eUANCM_View := 128,
    eUANCM_View := 128,
    eUANCM_All := 255
) DINT;
END_TYPE
```

Name	Description
eUANCM_Unspecified	Unspecified
eUANCM_Object	Object
eUANCM_Variable	Variable
eUANCM_Method	Method
eUANCM_ObjectType	ObjectType
eUANCM_VariableType	VariableType
eUANCM_ReferenceType	ReferenceType
eUANCM_DataType	DataType
eUANCM_View	View
eUANCM_AII	All

#### Requirements

Development environment	Target platform	PLC libraries to include
TwinCAT 3.1	Win32, Win64, CE-X86, CE-ARM	Tc3_PLCopen_OpcUa

## 5.2.1.8 E\_UASecurityMsgMode

#### **Syntax**

```
TYPE E_UASecurityMsgMode:
(
    eUASecurityMsgMode_BestAvailable := 0,
    eUASecurityMsgMode_None := 1,
    eUASecurityMsgMode_Sign := 2,
    eUASecurityMsgMode_Sign_Encrypt := 3
) DINT;
END TYPE
```

#### **Values**

Name	Description
eUASecurityMsgMode_BestAvailable	Highest available security
eUASecurityMsgMode_None	No security
eUASecurityMsgMode_Sign	Signing
eUASecurityMsgMode_Sign_Encrypt	Signing and encryption

#### Requirements

Development environment	Target platform	PLC libraries to include
TwinCAT 3.1	Win32, Win64, CE-X86, CE-ARM	Tc3_PLCopen_OpcUa

## 5.2.1.9 E\_UASecurityPolicy

#### **Syntax**

Name	Description
BestAvailable	Highest available security.
None	Guideline for configurations with minimal security requirements.
Basic128	Guideline for configurations with low to medium security requirements.
Basic128Rsa15	Defines a security guideline for configurations with moderate to high security requirements.
Basic256	Defines a security policy for configurations with high security requirements.

#### Requirements

Development environment	Target platform	PLC libraries to include
TwinCAT 3.1	Win32, Win64, CE-X86, CE-ARM	Tc3 PLCopen OpcUa

## 5.2.1.10 E\_UAServerState

#### **Syntax**

#### **Values**

Name	Description
Running	Running
Failed	Failed
NoConfiguration	NoConfiguration
Suspended	Suspended
Shutdown	Shutdown
Test	Test
CommunicationFault	CommunicationFault
Unknown	Unknown

#### Requirements

Development environment	Target platform	PLC libraries to include
TwinCAT 3.1	Win32, Win64, CE-X86, CE-ARM	Tc3_PLCopen_OpcUa

PLC library	Required version
Tc3_PLCopen_OpcUa	>= 3.2.11.0

## 5.2.1.11 E\_UATransportProfile

#### **Syntax**

```
eUATransportProfileUri_WSHttpXml := 4
)DINT;
END_TYPE
```

Name	Description
eUATransportProfileUri_UATcp	UATcp
eUATransportProfileUri_WSHttpBinary	WSHttpBinary
eUATransportProfileUri_WSHttpXmlOrBinary	WSHttpXmlOrBinary
eUATransportProfileUri_WSHttpXml	WSHttpXml

#### Requirements

Development environment	Target platform	PLC libraries to include
TwinCAT 3.1	Win32, Win64, CE-X86, CE-ARM	Tc3_PLCopen_OpcUa

## 5.2.1.12 E\_UAUserIdentityTokenType

#### **Syntax**

```
TYPE E_UAUserIdentityTokenType:
(
    eUAUITT_Anonymous := 0,
    eUAUITT_Username := 1,
    eUAUITT_x509 := 2,
    eUAUITT_IssuedToeken := 3
) DINT;
END_TYPE
```

#### **Values**

Name	Description
eUAUITT_Anonymous	Anonymous user.
eUAUITT_Username	Log in by user name.
eUAUITT_x509	Certificate file for logging in.
eUAUITT_IssuedToeken	Log in via token.

#### Requirements

Development environment	Target platform	PLC libraries to include
TwinCAT 3.1	Win32, Win64, CE-X86, CE-ARM	Tc3_PLCopen_OpcUa

## 5.2.1.13 ST\_UABrowseDescription

#### **Syntax**

```
TYPE ST_UABrowseDescription:

STRUCT

stStartingNodeId : ST_UANodeId;
eDirection : E_UABrowseDirection;
stReferenceTypeId : ST_UANodeId;
bIncludeSubtypes : BOOL;
eNodeClass : E_UANodeClassMask;
eResultMask : E_UABrowseResultMask;
END_STRUCT
END_TYPE
```

Name	Description
stStartingNodeId	Default Starting Node: ObjectRoot
eDirection	Default Browse Direction: Forward
stReferenceTypeId	Default ReferenceType: Hierarchical
blncludeSubtypes	Default IncludeSubtypes: TRUE
eNodeClass	Default NodeClassMask: All
eResultMask	Default BrowseResultMask: All

#### Requirements

Development environment	Target platform	PLC libraries to include
TwinCAT 3.1	Win32, Win64, CE-X86, CE-ARM	Tc3_PLCopen_OpcUa

### 5.2.1.14 ST\_UAExpandedNodelD

#### **Syntax**

```
TYPE ST_UAExpandedNodeID:
STRUCT
    nServerIndex : UDINT;
    sNamespaceURI : STRING(MAX_STRING_LENGTH);
    stNodeID : ST_UANodeID;
END_STRUCT
END_TYPE
```

#### **Values**

Name	Description
nServerIndex	ServerIndex
sNamespaceURI	NamespaceName
stNodeID	NodelD ( <u>ST_UANodelD [▶ 59]</u> )

#### Requirements

Development environment	Target platform	PLC libraries to include
TwinCAT 3.1	Win32, Win64, CE-X86, CE-ARM	Tc3_PLCopen_OpcUa

## 5.2.1.15 ST\_UASessionConnectInfo

#### **Syntax**

```
TYPE ST_UASessionConnectInfo:
STRUCT

sApplicationName : STRING (MAX_STRING_LENGTH);

eSecurityMode : E_UASecurityMsgMode;
eSecurityPolicyUri : E_UASecurityPolicy;
eTransportProfileUri : E_UATransportProfile;

tSessionTimeout : TIME;
tConnectTimeout : TIME;
END_STRUCT
END_TYPE
```

Name	Description
sApplicationUri (obsolete)	Application Uri maximum string length 255. From TcUAClient 2.0.0.14 or higher this is automatically specified by the certificate, as defined in the PLCOpen specification. Therefore no longer used in current library versions.
sApplicationName	Application name with a maximum string length of 255.
eSecurityMode	Security message mode. For available modes see <u>E_UASecurityMsgMode</u> [ <u>▶ 54]</u> .
eSecurityPolicyUri	Security policy Uri. For available security policy Uri see <u>E_UASecurityPolicy</u> [ <u>▶ 54]</u> .
eTransportProfileUri	Transport profile Uri. For available transport profile Uri see <u>E_UATransportProfile</u> [ <u>&gt; 55</u> ];
stUserIdentTokenType	Structure with authentication data for logging on to the OPC UA Server. Full description under <u>ST_UAUserIdentityTokenType</u> [▶ 61].
tSessionTimeout	Session timeout value.
tConnectTimeout	Value for the connection timeout. This must be set at the UA_Connect function block to match the ADS timeout. The rule of thumb is: ADS Timeout > 2 * ConnectionTimeout.

#### Requirements

Development environment	Target platform	PLC libraries to include
TwinCAT 3.1	Win32, Win64, CE-X86, CE-ARM	Tc3_PLCopen_OpcUa

## 5.2.1.16 ST\_UAIndexRange

#### **Syntax**

```
TYPE ST_UAIndexRange:
STRUCT

nStartIndex: UDINT;
nEndIndex: UDINT;
END_STRUCT
END_TYPE
```

#### **Values**

Name	Description
nStartIndex	Start index of the data.
nEndIndex	End index of the data.

#### For all dimensions:

- · StartIndex and EndIndex must be assigned.
- · StartIndex must be smaller than EndIndex.
- To be able to access all elements in a dimension, StartIndex and EndIndex must be assigned in the dimension depending on the total number of elements.
- Individual elements of a dimension can be selected by specifying the same StartIndex and EndIndex.

#### Requirements

Development environment	Target platform	PLC libraries to include
TwinCAT 3.1	Win32, Win64, CE-X86, CE-ARM	Tc3_PLCopen_OpcUa

## 5.2.1.17 ST\_UALocalizedText

#### **Syntax**

```
TYPE ST_UALocalizedText:
STRUCT
    sLocale : STRING(6);
    sText : STRING (MAX_STRING_LENGTH);
END_STRUCT
END_TYPE
```

#### **Values**

Name	Description
sLocale	Language identifier of the LocalizedText
sText	Text

#### Requirements

Development environment	Target platform	PLC libraries to include
TwinCAT 3.1	Win32, Win64, CE-X86, CE-ARM	Tc3_PLCopen_OpcUa

## 5.2.1.18 ST\_UAMethodArgInfo

#### **Syntax**

```
TYPE ST_UAMethodArgInfo:
STRUCT
DataType : E_UADataType := -1;
ValueRank : DINT := 2147483647;
ArrayDimensions : ARRAY[1..3] OF UDINT := [0,0,0];
nLenData : DINT;
END_STRUCT
END_TYPE
```

#### **Values**

Name	Description
DataType	Defines the UA data type for the method parameter. (Type: E_UADataType [▶ 51])
ValueRank	Determines whether the parameter is scalar (-1) or array.
ArrayDimensions	If the parameter is an array, it specifies the dimensions of the array. Each element determines the length per dimension.
nLenData	Specifies the length of the argument. For output information STRUCT only requests this element.

#### Requirements

Development environment	Target platform	PLC libraries to include
TwinCAT 3.1	Win32, Win64, CE-X86, CE-ARM	Tc3_PLCopen_OpcUa

## 5.2.1.19 ST\_UANodelD

#### **Syntax**

```
TYPE ST_UANodeID:

STRUCT

nNamespaceIndex : UINT;

nReserved : ARRAY [1..2] OF BYTE; //fill bytes

sIdentifier : STRING(MAX_STRING_LENGTH);

eIdentifierType : E_UAIdentifierType;

END_STRUCT

END_TYPE
```

Name	Description	
nNamespaceIndex	Namespace index under which the node is available. Can be determined with the function block	
	<u>UA GetNamespaceIndex [▶ 68]</u> .	
nReserved	Placeholder	
sldentifier	Identifier as shown in the UA namespace (attribute 'Identifier').	
eldentifierType	Variable type, described by <u>E_UAldentifierType [▶ 53]</u> .	

#### Requirements

Development environment	Target platform	PLC libraries to include
TwinCAT 3.1	Win32, Win64, CE-X86, CE-ARM	Tc3_PLCopen_OpcUa

## 5.2.1.20 ST\_UANodeAdditionalInfo

#### **Syntax**

```
TYPE ST_UANodeAdditionalInfo:

STRUCT

eAttributeID : E_UAAttributeID;

nIndexRangeCount : UINT;

nReserved : ARRAY[1..2] OF BYTE; // fill bytes

stIndexRange : ARRAY[1..nMaxIndexRange] OF ST_UAIndexRange;

END_STRUCT

END_TYPE
```

#### **Values**

Name	Description	
eAttributeID	Specifies the ID of the OPC UA attribute. eUAAI_Value is used by default. (Type:	
	<u>E_UAAttributeID [▶ 49]</u> ).	
nIndexRangeCount	Determines how many index ranges are used in stIndexRange.	
nReserved	Placeholder	
stIndexRange	Specifies an index range for reading values from an array. (Type:	
	ST_UAIndexRange [▶ 58]).	

#### Requirements

Development environment	Target platform	PLC libraries to include
TwinCAT 3.1	Win32, Win64, CE-X86, CE-ARM	Tc3_PLCopen_OpcUa

## 5.2.1.21 ST\_UAReferenceDescription

#### **Syntax**

```
TYPE ST_UAReferenceDescription:

STRUCT

stReferenceTypeId: ST_UANodeId;
bIsForward: BOOL;
stNodeId: ST_UAExpandedNodeId;
stBrowseName: ST_UAExpandedNodeId;
stDisplayName: ST_UALocalizedText;
eNodeClass: E_UANodeClassMask;
stTypeDefinition: ST_UAExpandedNodeId;
END_STRUCT
END_TYPE
```

Name	Description
stReferenceTypeId	Nodeld of the reference type (e.g. Organizes, HasChild, HasTypeDefinition,) as
	data type <u>ST_UANodeId [▶ 59]</u> .
blsForward	Indicates whether the reference is a forward or backward reference.
stNodeld	Nodeld as data type <u>ST_UAExpandedNodeld [▶ 57]</u> .
stBrowseName	BrowseName of the reference.
stDisplayName	DisplayName of the reference (ST_UALocalizedText [▶ 59]).
eNodeClass	NodeClass of the reference ( <u>E_UANodeClassMask</u> [▶ <u>53]</u> ).
stTypeDefinition	Type definition (HasTypeDefinition) ( <u>ST_UAExpandedNodeId [▶ 57]</u> ).

#### Requirements

Development environment	Target platform	PLC libraries to include
TwinCAT 3.1	Win32, Win64, CE-X86, CE-ARM	Tc3_PLCopen_OpcUa

## 5.2.1.22 ST\_UAUserIdentityTokenType

#### **Syntax**

```
TYPE ST_UAUserIdentityTokenType:

STRUCT

eUserIdentTokenType : E_UAUserIdentityTokenType;

sTokenParam1 : STRING (MAX_STRING_LENGTH);

sTokenParam2 : STRING (MAX_STRING_LENGTH);

END_STRUCT

END_TYPE
```

#### **Values**

Name	Description
eUserIdentTokenType	Type of user, described using
	<u>E UAUserIdentityTokenType</u> [▶ <u>56</u> ]
sTokenParam1	User name for logging on to the OPC UA Server.
sTokenParam2	Password for logging on to the OPC UA Server.

#### Requirements

Development environment	Target platform	PLC libraries to include
TwinCAT 3.1	Win32, Win64, CE-X86, CE-ARM	Tc3_PLCopen_OpcUa

#### 5.2.1.23 UAHADataValue

This function block acts as a data object. An instance represents a value for the OPC UA Historical Access function. A whole field of these values is transferred to the <u>UA HistoryUpdate [\* 69]</u> function block on calling.

#### **Syntax**

```
aDataValues : ARRAY [1..50] OF UAHADataValue(ValueSize:=SIZEOF(LREAL));
```

Each data object is initialized with the expected size (in bytes) of the value.

#### Properties

Name	Туре	Access	Initial value	Description
Value	PVOID	Set	-	Specifies the address of a variable containing the desired value. This is usually assigned with the help of the operator ADR(). The value itself is hereby assigned at the same time and copied into the data object.
StatusCode	UAHAUpdateSt atusCode [ <u>&gt; 62</u> ]	Get, Set	UAHAUpdateStat usCode.Historian Raw	Indicates the status code of the value.
SourceTimeStamp	ULINT	Get, Set	0	Indicates the timestamp of the source in UTC format. This can be determined with the help of the function F_GetSystemTime (Tc2_System PLC library).
ServerTimeStamp	ULINT	Get, Set	0	Indicates the timestamp of the OPC UA Server in UTC format. This function is not currently supported.

#### Data type size of the value

The size of the data type used is already indicated and thus defined in the declaration of the data object. This size is taken as the basis when assigning a value later.

Values of the type STRING are accordingly also saved and transmitted with a fixed initialized size. An indication of the current text length cannot be made.

#### Sample

```
{attribute 'OPC.UA.DA' := '1'}
fMyValue : LREAL; // Variable for HistorcalAccess
aDataValues : ARRAY [1..50] OF UAHADataValue(ValueSize:=SIZEOF(LREAL));
fMyValue := 27.75;
aDataValues[1].Value
                                := ADR(fMyValue);
aDataValues[1].StatusCode
                                := UAHAUpdateStatusCode.HistorianRaw;
aDataValues[1].SourceTimeStamp := F_GetSystemTime();
```

In this sample a field of 50 values is defined, of which each is represented by a data object. The current content of the variable fMyValue (= 27.75) is assigned to the first value.

The field can now be filled by means of further assignments in subsequent PLC cycles.

#### Requirements

Development environment	Target platform	PLC libraries to include
TwinCAT 3.1 >= 4024.1	Win32, Win64, WinCE-x86	Tc3_PLCopen_OpcUa
		>= v3.1.9.0

#### 5.2.1.24 **UAHAUpdateStatusCode**

A status code is assigned to each data value transferred using the OPC UA Historical Access function. This is a property of the object <u>UAHADataValue</u> [▶ 61].

#### **Syntax**

#### **Values**

Name	Description
HistorianRaw	HistorianRaw
HistorianCalculated	HistorianCalculated
HistorianInterpolated	HistorianInterpolated
Reserved	Reserved
HistorianPartial	HistorianPartial
HistorianExtraData	HistorianExtraData
HistorianMultiValue	HistorianMultiValue

#### Requirements

Development environment	Target platform	PLC libraries to include
TwinCAT 3.1 >= 4024.1	Win32, Win64, WinCE-x86	Tc3_PLCopen_OpcUa
		>= v3.1.9.0

## 5.2.2 Function blocks

#### 5.2.2.1 **UA\_Browse**

	UA_Browse		
_	Execute BOOL	BOOL Done	-
_	ConnectionHdl DWORD	BOOL Busy	-
_	BrowseDescription ST_UABrowseDescription	BOOL Error	-
_	ContinuationPointIn DWORD	DWORD ErrorID	-
_	Timeout TIME DWORD	ContinuationPointOut	-
_	ReferenceDescriptions POINTER TO ST_UAReferenceDescription UDINT	cbBrowseResultCount	-

This function block allows browsing through the namespace of a server. Starting from a start node, its references are read and returned accordingly.

## Inputs

```
VAR_INPUT

Execute : BOOL;
ConnectionHdl : DWORD;
BrowseDescription : ST_UABrowseDescription;
ContinuationPointIn : DWORD;
Timeout : TIME;
END_VAR
```

Name	Туре	Description
Execute	BOOL	The command is triggered by a rising edge at this input.
ConnectionHdl	DWORD	Connection handle previously output by the function block UA_Connect.
BrowseDescription	ST_UABrowseDescription [ > 56]	The address information for the node to be read is specified here.
ContinuationPointIn	DWORD	If a previous call of the function block returned a value as ContinuationPointOut, this value can be created here to get further data from the server.
Timeout	TIME	Time until the function is aborted.

# ✓ Inputs/outputs

VAR\_IN\_OUT
ReferenceDescriptions: POINTER TO ST\_UAReferenceDescriptions;
END\_VAR

Name	Туре	Description
ReferenceDescript	POINTER	Contains the list of ReferenceDescriptions returned by the server, i.e. the
ions	TO	result of the UA_Browse call. The contained ReferenceDescriptions can
	ST_UARef	then be used for further UA_Browse calls in the BrowseDescription, e.g. to
	erenceDes	navigate deeper into the namespace.
	criptions	

## Outputs

VAR\_OUTPUT

Done : BOOL;
Busy : BOOL;
Error : BOOL;
ErrorID : DWORD;
ContinuationPointOut : DWORD;
cbBrowseResultCnt : UDINT;
END\_VAR

Name	Туре	Description
Done	BOOL	Switches to TRUE if the function block was executed successfully.
Busy	BOOL	TRUE until the function block has executed a command, at the most for the duration of the "Timeout" at the input. The inputs accept no new command as long as Busy = TRUE. It is not the connection time that is monitored but the reception time.
Error	BOOL	Switches to TRUE if an error occurs while executing a command. The command-specific error code is included in ErrorID.
ErrorID	DWORD	Contains the command-specific error code of the most recently executed command.
ContinuationPoint Out	DWORD	If the server returns data batch-wise (ContinuationPointOut != 0), the value of ContinuationPointOut can be used as ContinuationPointIn at the next call of the function block to get the further data.
cbBrowseResultC nt	UDINT	Number of ReferenceDescriptions.

#### Requirements

Development environment	Target platform	PLC libraries to include
TwinCAT 3.1	Win32, Win64, CE-X86, CE-ARM	Tc3_PLCopen_OpcUa

## 5.2.2.2 UA\_Connect

```
UA_Connect

Execute BOOL
ServerUrl STRING(MAX_STRING_LENGTH)
SessionConnectInfo ST_UASessionConnectInfo
Timeout TIME

DWORD ConnectionHdl
BOOL Done
BOOL Busy
BOOL Error
DWORD ErrorID
```

This function block establishes an OPC UA Remote connection to another OPC UA Server, which is specified via ServerUrl and SessionConnectInfo. The function block returns a connection handle that can be used for other function blocks, such as UA\_Read.

## Inputs

VAR\_INPUT

Execute : BOOL;
ServerUrl : STRING (MAX\_STRING\_LENGTH);
SessionConnectInfo : ST\_UASessionConnectInfo;
Timeout : TIME := DEFAULT\_ADS\_TIMEOUT;
END VAR

Name	Туре	Description
Execute	BOOL	The command is triggered by a rising edge at this input.
ServerUrl	STRING(MAX_STRING_LENGTH)	OPC UA Server URL, i.e. 'opc.tcp:// 172.16.3.207:4840' or 'opc.tcp:// CX_0193BF:4840'.
SessionConnectInfo	ST_UASessionConnectInfo	Connection information (see ST_UASessionConnectInfo [▶ 57])
Timeout	TIME	Time until the function is aborted.  DEFAULT_ADS_TIMEOUT is a global constant, set to 5 seconds. The value must be set to match the ST_UASessionConnectInfo.tConnectionTimeout. The rule of thumb is: ADS Timeout > 2 * ConnectionTimeout.

## Outputs

VAR\_OUTPUT

ConnectionHdl : DWORD;

Done : BOOL;

Busy : BOOL;

Error : BOOL;

ErrorID : DWORD;

END\_VAR

Name	Type	Description
ConnectionHdl	DWORD	OPC UA connection handle.
Done	BOOL	Switches to TRUE if the function block was executed successfully.
Busy	BOOL	TRUE until the function block has executed a command, at the most for the duration of the "Timeout" at the input. The inputs accept no new command as long as Busy = TRUE. It is not the connection time that is monitored but the reception time.
Error	BOOL	Switches to TRUE if an error occurs while executing a command. The command-specific error code is included in ErrorID.
ErrorID	DWORD	Contains the command-specific error code of the most recently executed command.

#### Requirements

Development environment	Target platform	PLC libraries to include
TwinCAT 3.1	Win32, Win64, CE-X86, CE-ARM	Tc3_PLCopen_OpcUa

## 5.2.2.3 UA\_ConnectGetStatus

```
UA_ConnectGetStatus

Execute BOOL
ConnectionHdl DWORD
GetServiceLevel BOOL
Timeout TIME

E_UAConnectionStatus ConnectionStatus
E_UAServerState
BYTE ServiceLevel
```

This function block checks the connection status of an existing connection to another OPC UA Server. The connection is referenced via the respective connection handle. The status is then returned as <a href="EUAConnectionStatus"><u>E UAConnectionStatus</u></a> [\*\* 51]. The connection status is determined based on the internal session info or the OPC UA heartbeat, no additional communication (read or similar) is performed.

The service level of the OPC UA Server can be read out via the additional input parameter GetServiceLevel. For this purpose, a read command is sent to the server in the background to determine this information.

#### Inputs

```
VAR_INPUT

Execute : BOOL;

ConnectionHdl : DWORD;

GetServiceLevel : BOOL;

Timeout : TIME := DEFAULT_ADS_TIMEOUT;

END_VAR
```

Name	Туре	Description
Execute	BOOL	The command is triggered by a rising edge at this input.
ConnectionHdl	DWORD	Connection handle of an existing communication link.
GetServiceLevel	BOOL	Reads out the ServiceLevel of the OPC UA Server.
Timeout	TIME	Time until the function is aborted. DEFAULT_ADS_TIMEOUT is a global constant, set to 5 seconds. The value must be set to match the ST_UASessionConnectInfo.tConnectionTimeout. The rule of thumb is: ADS Timeout > 2 * ConnectionTimeout.

## Outputs

```
VAR_OUTPUT

Done : BOOL;

Busy : BOOL;

Error : BOOL;

ErrorID : DWORD;

ConnectionStatus : E_UAConnectionStatus;

ServerState : E_UAServerState;

ServiceLevel : BYTE;

END_VAR
```

Name	Туре	Description
Done	BOOL	Switches to TRUE if the function block was executed successfully.
Busy	BOOL	TRUE until the function block has executed a command, at the most for the duration of the "Timeout" at the input. The inputs accept no new command as long as Busy = TRUE. It is not the connection time that is monitored but the reception time.
Error	BOOL	Switches to TRUE if an error occurs while executing a command. The command-specific error code is included in ErrorID.
ErrorID	DWORD	Contains the command-specific error code of the most recently executed command.
ConnectionStatus	E_UAConnectionStatus	Connection status (see <u>E_UAConnectionStatus</u> [ <u>&gt; 51]</u> ).
ServerState	E_UAServerState	Server state (see <u>E_UAServerState [▶ 55]</u> ).
ServerState	BYTE	ServiceLevel of the OPC UA Server.

#### Requirements

Development environment	Target platform	PLC libraries to include
TwinCAT 3.1	Win32, Win64, CE-X86, CE-ARM	Tc3_PLCopen_OpcUa

PLC library	Required version	
Tc3_PLCopen_OpcUa	>= 3.2.11.0	

## 5.2.2.4 UA\_Disconnect

This function block closes an OPC UA Remote connection to another OPC UA Server. The connection is specified via its connection handle.

#### **Disconnect all connections**

If the UA-Disconnect method is called and a connection handle of 0 is passed, the OPC UA client disconnects all existing connections. This also applies to connections established via an OPC UA I/O client configuration.

## Inputs

VAR\_INPUT
Execute : BOOL;
ConnectionHdl : DWORD;
Timeout : TIME := DEFAULT\_ADS\_TIMEOUT;
END\_VAR

Name	Туре	Description
Execute	BOOL	The command is triggered by a rising edge at this input.
ConnectionHdl	DWORD	Connection handle previously output by the function block UA_Connect.
Timeout	TIME	Time until the function is aborted. DEFAULT_ADS_TIMEOUT is a global constant, set to 5 seconds.

### Outputs

```
VAR_OUTPUT

Done : BOOL;

Busy : BOOL;

Error : BOOL;

ErrorID : DWORD;

END_VAR
```

Name	Type	Description
Done	BOOL	Switches to TRUE if the function block was executed successfully.
Busy	BOOL	TRUE until the function block has executed a command, at the most for the duration of the "Timeout" at the input. The inputs accept no new command as long as Busy = TRUE. It is not the connection time that is monitored but the reception time.
Error	BOOL	Switches to TRUE if an error occurs while executing a command. The command-specific error code is contained in nErrID.
ErrorID	DWORD	Contains the command-specific error code of the most recently executed command.

#### Requirements

Development environment	Target platform	PLC libraries to include
TwinCAT 3.1	Win32, Win64, CE-X86, CE-ARM	Tc3_PLCopen_OpcUa

## 5.2.2.5 UA\_GetNamespaceIndex

```
UA_GetNamespaceIndex

Execute BOOL
ConnectionHdl DWORD
NamespaceUri STRING(MAX_STRING_LENGTH)
Timeout TIME

UINT NamespaceIndex
BOOL Done
BOOL Busy
BOOL Error
DWORD ErrorID
```

This function block collects the namespace index for a namespace URI. The namespace index is required for identifying symbols, for example, if the function blocks <u>UA Read</u> [▶ 80]or <u>UA Write</u> [▶ 82]are used.

### Inputs

Name	Туре	Description
Execute	BOOL	The command is triggered by a rising edge at this input.
ConnectionHdl	DWORD	Connection handle previously output by the function block UA_Connect.
NamespaceUri	STRING	Namespace URI to be resolved. For the TwinCAT OPC UA Server, this is "urn:BeckhoffAutomation:Ua:PLC1"" for the first PLC runtime.
Timeout	TIME	Time until the function is aborted. DEFAULT_ADS_TIMEOUT is a global constant, set to 5 seconds.

## Outputs

```
VAR_OUTPUT

NamespaceIndex : UINT;
Done : BOOL;
Busy : BOOL;
Error : BOOL;
ErrorID : DWORD;

END_VAR
```

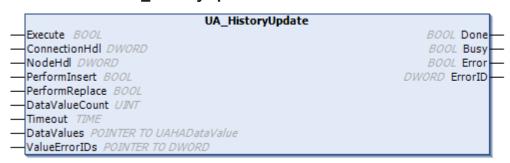

Name	Туре	Description	
NamespaceIndex	UINT	Namespace Index of the given namespace URI. This can be used in other function blocks, e.g. UA_NodeGetHandle or UA_MethodGetHandle.	
Done	BOOL	Switches to TRUE if the function block was executed successfully.	
Busy	BOOL	TRUE until the function block has executed a command, at the most for the duration of the "Timeout" at the input. The inputs accept no new command as long as Busy = TRUE. It is not the connection time that is monitored but the reception time.	
Error	BOOL	Switches to TRUE if an error occurs while executing a command. The command-specific error code is included in ErrorID.	
ErrorlD	DWORD	Contains the command-specific error code of the most recently executed command.	

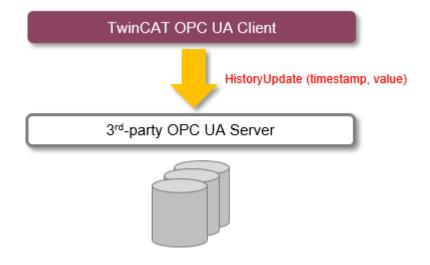

#### Requirements

Development environment	Target platform	PLC libraries to include
TwinCAT 3.1	Win32, Win64, CE-X86, CE-ARM	Tc3_PLCopen_OpcUa

## 5.2.2.6 UA\_HistoryUpdate

This function block sends historical data via OPC UA to a server that supports the OPC UA HistoryUpdate function, e.g. the TwinCAT OPC UA Server. With one call you can transfer a large number of values including time stamps to the server for a node handle. The server ensures that the values transmitted are saved in a data memory and are available via Historical Access.

The function block can be instanced several times if values of several node handles (different variables) are to be transmitted.

#### **Operation with TwinCAT OPC UA Server**

The function block is well suited if you use Historical Access in the TwinCAT OPC UA Server and want to make data available from a certain time interval in which, for example, a special machine state prevailed. Values for the desired period can be purposefully transmitted.

If on the other hand values are sent cyclically and are to be made available in the server via Historical Access, then the Historical Access function on the server side is better suited, as in this case you only have to configure the recording node in the configurator and set the desired sampling rate.

See also: Program sample TF6100\_OPCUA\_HASample

#### Inputs

```
VAR_INPUT

Execute : BOOL;
ConnectionHdl : DWORD;
NodeHdl : DWORD;
PerformInsert : BOOL;
PerformReplace : BOOL;
DataValueCount : UINT;
Timeout : TIME := DEFAULT_ADS_TIMEOUT;
END_VAR
```

Name	Туре	Description
Execute	BOOL	The command is triggered by a rising edge at this input.
ConnectionHdl	DWORD	Connection handle previously output by the function block UA_Connect.
NodeHdl	DWORD	Node handle that was previously output by the function block UA_NodeGetHandle.
PerformInsert	BOOL	The default is TRUE.
PerformReplace	BOOL	The default is FALSE. If a value for the given timestamp already exists in the history, it should be replaced if the PerformReplace option is set (= TRUE). Currently this option can only be selected for SQL adapters. Other adapters do not support the option.
DataValueCount	UINT	Defines the number of values transferred. A maximum number of 1000 values is supported.
Timeout	TIME	Time until the function is aborted. DEFAULT_ADS_TIMEOUT is a global constant, set to 5 seconds.

## **▼/** Inputs/outputs

```
VAR_IN_OUT
DataValues : ARRAY[*] OF UAHADataValue;
ValueErrorIDs : ARRAY[*] OF DWORD;
END_VAR
```

Name	Туре	Description
DataValues (read-only)	ARRAY	All collected values are transferred in the form of a field of the type UAHADataValue. The length of the field is not prescribed, but it must correspond at least to the specification of DataValueCount. Internally the values are accessed only for reading.
ValueErrorIDs (write-only)	ARRAY	After execution of the command this field contains an error code for each value. The length of the field must correspond at least to the specification of DataValueCount. If one or more values report an error, it is also signaled via the outputs Error and ErrorID of the function block. With the help of this field you can then determine which error has occurred for which value. The error code 16#80000000, for example, signalizes a failed operation, meaning that the value could not be written.

#### Outputs

VAR\_OUTPUT
Done : BOOL;
Busy : BOOL;
Error : BOOL;
ErrorID : DWORD;
END VAR

Name	Туре	Description
Done	BOOL	Switches to TRUE if the function block was executed successfully.
Busy	BOOL	TRUE until the function block has executed a command, at the most for the duration of the "Timeout" at the input. The inputs accept no new command as long as Busy = TRUE. It is not the connection time that is monitored but the reception time.
Error	BOOL	Switches to TRUE if an error occurs while executing a command. The command-specific error code is included in ErrorID.
ErrorID	DWORD	Contains the command-specific ADS error code of the most recently executed command.

#### Number of values transferred

The larger the number, the greater the required computing effort and thus the longer the PLC execution time when executing the command.

#### Requirements

Development environment	Target platform	PLC libraries to include
TwinCAT 3.1 >= 4024.1	Win32, Win64, WinCE-x86	Tc3_PLCopen_OpcUa
		>= v3.1.9.0

## 5.2.2.7 UA\_MethodCall

```
UA_MethodCall
Execute BOOL
                                                                              UDINT cbRead_R
ConnectionHdl DWORD
                                                                                   BOOL Done
MethodHdl DWORD
                                                                                    BOOL Busy
nNumberOfInputArguments UDINT
                                                                                    BOOL Error
                                                                                DWORD ErrorID
pInputArgInfo POINTER TO ST_UAMethodArgInfo
cbInputArgInfo UDINT
pInputArgData PVOID
cbInputArgData UDIN7
pInputWriteData PVOID
cbInputWriteData UDINT
nNumberOfOutputArguments UDINT
pOutputArgInfo POINTER TO ST_UAMethodArgInfo
cbOutputArgInfo UDIN7
pOutputArgInfoAndData PVOID
cbOutputArgInfoAndData UDIN7
Timeout TIME
```

This function block calls a method on a remote UA Server. The method is determined by a connection and a method handle. The former can be queried by <u>UA Connect [> 65]</u>, the latter by <u>UA MethodGetHandle</u> [> 74].

## Inputs

VAR\_INPUT
Execute : BOOL;
ConnectionHdl : DWORD;
MethodHdl : DWORD;

```
nNumberOfInputArguments
pInputArgInfo
cbInputArgInfo
cbInputArgData
cbInputArgData
cbInputWriteData
cbInputWriteData
cbInputWriteData
cbInputArguments
pOutputArguments
pOutputArgInfo
cbOutputArgInfo
cbOutputArgInfoAndData
```

Name	Туре	Description
Execute	BOOL	The command is triggered by a rising edge at this input.
ConnectionHdl	DWORD	Connection handle previously output by the function block UA_Connect.
MethodHdl	DWORD	Method handle, previously output by the function block UA_MethodGetHandle.
nNumberOfInputAr guments	UDINT	Number of input parameters.
pInputArgInfo	POINTER TO ST_UAMethodArgInfo	Points to the buffer address where input parameter information is stored in the form of an array ST_UAMethodArgInfo.
cbInputArgInfo	UDINT	Size of the buffer where the input parameter information is stored.
pInputArgData	PVOID	Points to the buffer address where input parameters (constant length) are stored.
cbInputArgData	UDINT	Size of the input buffer where input parameters (with constant length) are stored.
pInputWriteData	PVOID	Pointer to buffer address where input parameters (dynamic length) are stored.
cbInputWriteData	UDINT	Size of the input buffer where input parameters (with dynamic length) are stored.
nNumberOfOutput Arguments	UDINT	Number of output parameters.
pOutputArgInfo	POINTER TO ST_UAMethodArgInfo	Points to the buffer address where output parameter information is stored as array ST_UAMethodArgInfo.
		nLenData is required to determine the target memory of the individual output parameters. The other elements can be set in such a way that a type check of the returned parameters takes place or remains undefined.
cbOutputArgInfo	UDINT	Size of the buffer where the output parameter information is stored.
pOutputArgInfoAn dData	PVOID	Points to the buffer address where the output parameters are to be saved as a BYTE array. The BYTE array contains the number of output parameters as DINT, four reserved bytes and parameter information as ARRAY OF <u>ST_UAMethodArgInfo</u> [* <u>59</u> ] (with the length of the output parameters), followed by pure data. Note that the data is packed as 1-byte alignment.
cbOutputArgInfoA ndData	UDINT	Size of the buffer in which the output parameters are to be saved as a BYTE array.
Timeout	TIME	Time until the function is aborted.  DEFAULT_ADS_TIMEOUT is a global constant, set to 5 seconds.

## Outputs

VAR\_OUTPUT

cbRead\_R : UDINT; Done : BOOL;

: BOOL; Busy Error : BOOL; ErrorID : UDINT; END\_VAR

Name	Туре	Description
cbRead_R	UDINT	Counts all the bytes received.
Done	BOOL	Switches to TRUE if the function block was executed successfully.
Busy	BOOL	TRUE until the function block has executed a command, at the most for the duration of the "Timeout" at the input. The inputs accept no new command as long as Busy = TRUE. It is not the connection time that is monitored but the reception time.
Error	BOOL	Switches to TRUE if an error occurs while executing a command. The command-specific error code is contained in nErrID.
ErrorID	UDINT	Contains the command-specific error code of the most recently executed command.

#### Requirements

Development environment	Target platform	PLC libraries to include
TwinCAT 3.1	Win32, Win64, CE-X86, CE-ARM	Tc3_PLCopen_OpcUa

#### 5.2.2.8 **UA\_MethodGetHandle**

This function block collects a handle for a UA method, which can then be used to call a method using UA MethodCall [▶ 71].

#### Inputs

VAR INPUT INPUT

Execute : BOOL;

ConnectionHdl : DWORD;

ObjectNodeID : ST\_UANOdeID;

MethodNodeID : ST\_UANOdeID;

Timeout : TIME := DEFAULT\_ADS\_TIMEOUT;

END\_VAR

Name	Туре	Description
Execute	BOOL	The command is triggered by a rising edge at this input.
ConnectionHdl	DWORD	Connection handle previously output by the function block UA_Connect.
ObjectNodeID	ST_UANodeID	Object node ID of the method to be called. (Type: <u>ST_UANodeID</u> [ <u>▶ 59]</u> ).
MethodNodeID	ST_UANodeID	Method node ID of the method to be called. Corresponds to the ID attribute in the UA namespace. (Type: <u>UA Connect</u> [▶ 65]).
Timeout	TIME	Time until the function is aborted. DEFAULT_ADS_TIMEOUT is a global constant, set to 5 seconds.

#### Outputs

VAR\_OUTPUT MethodHdl : DWORD; Done : BOOL;
Busy : BOOL;
Error : BOOL;
ErrorID : UDINT;
VAR END VAR

Name	Туре	Description
MethodHdl	DWORD	Returns a method handle that can be used to call a method via <u>UA_MethodCall</u>
		[ <u>N 71]</u> .
Done	BOOL	Switches to TRUE if the function block was executed successfully.
Busy	BOOL	TRUE until the function block has executed a command, at the most for the duration of the "Timeout" at the input. The inputs accept no new command as long as Busy = TRUE. It is not the connection time that is monitored but the reception time.
Error	BOOL	Switches to TRUE if an error occurs while executing a command. The command-specific error code is contained in nErrID.
ErrorID	UDINT	Contains the command-specific error code of the most recently executed command.

#### Requirements

Development environment	Target platform	PLC libraries to include
TwinCAT 3.1	Win32, Win64, CE-X86, CE-ARM	Tc3_PLCopen_OpcUa

#### **UA\_MethodReleaseHandle** 5.2.2.9

This function block releases the specified method handle.

#### Inputs

VAR\_INPUT INFUT
Execute : BOOL;
ConnectionHdl : DWORD;
MethodHdl : DWORD;
Timeout : TIME := DEFAULT\_ADS\_TIMEOUT;

END\_VAR

Name	Туре	Description
Execute	BOOL	The command is triggered by a rising edge at this input.
ConnectionHdl	DWORD	Connection handle previously output by the function block UA_Connect.
MethodHdI	DWORD	Method handle previously output by the function block UA_MethodGetHandle.
Timeout	TIME	Time until the function is aborted. DEFAULT_ADS_TIMEOUT is a global constant, set to 5 seconds.

## Outputs

VAR OUTPUT : BOOL; Done Busy : BOOL;

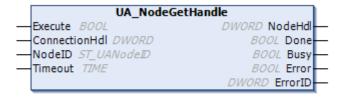

Error : BOOL; ErrorID : UDINT; END VAR

Name	Туре	Description
Done	BOOL	Switches to TRUE if the function block was executed successfully.
Busy	BOOL	TRUE until the function block has executed a command, at the most for the duration of the "Timeout" at the input. The inputs accept no new command as long as Busy = TRUE. It is not the connection time that is monitored but the reception time.
Error	BOOL	Switches to TRUE if an error occurs while executing a command. The command-specific error code is contained in nErrID.
ErrorID	UDINT	Contains the command-specific ADS error code of the most recently executed command.

#### Requirements

Development environment	Target platform	PLC libraries to include
TwinCAT 3.1	Win32, Win64, CE-X86, CE-ARM	Tc3_PLCopen_OpcUa

### 5.2.2.10 UA\_NodeGetHandle

This function block queries a node handle for a given symbol in the UA namespace. The symbol is specified by a connection handle and its node ID.

#### Inputs

VAR\_INPUT

Execute : BOOL;

ConnectionHdl : DWORD;

NodeID : ST\_UANodeID;

Timeout : TIME := DEFAULT\_ADS\_TIMEOUT;

END VAR

Name	Туре	Description
Execute	BOOL	The command is triggered by a rising edge at this input.
ConnectionHdI	DWORD	Connection handle previously output by the function block UA_Connect.
Node ID	ST_UANodeID	Unique addressing of the UA node, consisting of Identifier, IdentifierType and NamespaceIndex, which are resolved from a NamespaceName, e.g. by means of the method UA GetNamespaceIndex [▶ 68].
Timeout	TIME	Time until the function is aborted. DEFAULT_ADS_TIMEOUT is a global constant, set to 5 seconds.

## Outputs

```
VAR_OUTPUT

NodeHdl : DWORD;
Done : BOOL;
Busy : BOOL;
Error : BOOL;
ErrorID : DWORD;

END_VAR
```

Name	Туре	Description
NodeHdl	DWORD	Node handle that can be used for other function blocks, such as UA_Read or UA_Write.
Done	BOOL	Switches to TRUE if the function block was executed successfully.
Busy	BOOL	TRUE until the function block has executed a command, at the most for the duration of the "Timeout" at the input. The inputs do not accept new commands as long as Busy is TRUE. It is not the connection time that is monitored but the reception time.
Error	BOOL	Switches to TRUE if an error occurs while executing a command. The command-specific error code is included in ErrorID.
ErrorID	DWORD	Contains the command-specific ADS error code of the most recently executed command.

Development environment	Target platform	PLC libraries to include
TwinCAT 3.1	Win32, Win64, CE-X86, CE-ARM	Tc3_PLCopen_OpcUa

## 5.2.2.11 UA\_NodeGetHandleList

This function block queries node handles for nodes in the UA namespace.

#### Inputs

```
VAR_INPUT

Execute : BOOL;
ConnectionHdl : DWORD;
NodeIDCount : UINT;
NodeIDs : ARRAY[1..nMaxNodeIDsInList] OF ST_UANodeID;
Timeout : TIME := DEFAULT_ADS_TIMEOUT;
END_VAR
```

Name	Туре	Description	
Execute	BOOL	The command is triggered by a rising edge at this input.	
ConnectionHdl	DWORD	Connection handle previously output by the function block UA_Connect.	
NodelDCount	UINT	Number of nodes for which a node handle is required.	
NodelDs	ARRAY	Array of NodelDs created with struct <u>ST_UANodelD [▶ 59]</u> .	
Timeout	TIME	Time until the function is aborted. DEFAULT_ADS_TIMEOUT is a global constant, set to 5 seconds.	

### Outputs

```
VAR_OUTPUT

NodeHdls : ARRAY[1..nMaxNodeIDsInList] OF DWORD;
NodeErrorIDs : ARRAY[1..nMaxNodeIDsInList] OF DWORD;
cbData_R : UDINT;
Done : BOOL;
Busy : BOOL;
Error : BOOL;
ErrorID : DWORD;
END_VAR
```

Name	Туре	Description	
NodeHdls	ARRAY	Array of requested node handles.	
NodeErrorIDs	ARRAY	Array of error IDs if no node handles are available.	
cbData_R	UDINT	Size of the data read.	
Done	BOOL	Switches to TRUE if the function block was executed successfully.	
Busy	BOOL	TRUE until the function block has executed a command, at the most for the duration of the "Timeout" at the input. The inputs accept no new command as long as Busy = TRUE. It is not the connection time that is monitored but the reception time.	
Error	BOOL	Switches to TRUE if an error occurs while executing a command. The command-specific error code is in nErrID.	
ErrorID	DWORD	Contains the error ID if an error occurs.	

Development environment	Target platform	PLC libraries to include
TwinCAT 3.1	Win32, Win64, CE-X86, CE-ARM	Tc3_PLCopen_OpcUa

## 5.2.2.12 UA\_NodeReleaseHandle

	UA_NodeReleaseHan	ıdle
Execute		BOOL Done
Connec	tionHdl DWORD	BOOL Busy
NodeH	dl DWORD	BOOL Error
-Timeou	t TIME	DWORD ErrorID

This function block releases a node handle.

## Inputs

```
VAR_INPUT

Execute : BOOL;
ConnectionHdl : DWORD;
NodeHdl : DWORD;
Timeout : TIME := DEFAULT_ADS_TIMEOUT;
END_VAR
```

Name	Туре	Description	
Execute	BOOL	The command is triggered by a rising edge at this input.	
ConnectionHdl	DWORD	Connection handle previously output by the function block UA_Connect.	
NodeHdl	DWORD	Node handle to be released.	
Timeout	TIME	Time until the function is aborted. DEFAULT_ADS_TIMEOUT is a global constant, set to 5 seconds.	

### Outputs

```
VAR_OUTPUT

Done : BOOL;
Busy : BOOL;
Error : BOOL;
ErrorID : DWORD;
END_VAR
```

Name	Туре	Description
Done	BOOL	Switches to TRUE if the function block was executed successfully.
Busy	BOOL	TRUE until the function block has executed a command, at the most for the duration of the "Timeout" at the input. The inputs accept no new command as long as Busy = TRUE. It is not the connection time that is monitored but the reception time.
Error	BOOL	Switches to TRUE if an error occurs while executing a command. The command-specific error code is included in ErrorID.
ErrorID	DWORD	Contains the command-specific ADS error code of the most recently executed command.

Development environment	Target platform	PLC libraries to include
TwinCAT 3.1	Win32, Win64, CE-X86, CE-ARM	Tc3_PLCopen_OpcUa

## 5.2.2.13 UA\_NodeReleaseHandleList

	UA_NodeReleas	
_	Execute BOOL	ARRAY [1nMaxNodeIDsInList] OF DWORD NodeErrorIDs—
_	ConnectionHdl DWORD	BOOL Done—
_	NodeHdlCount UINT	BOOL Busy—
_	NodeHdls ARRAY[1nMaxNodeIDsInList] OF DWORD	BOOL Error —
_	Timeout TIME	DWORD ErrorID

This function block releases several node handles.

## Inputs

```
VAR_INPUT
Execute : BOOL;
ConnectionHdl : DWORD;
NodeHdlCount : UINT;
NodeHdls : ARRAY[1..nMaxNodeIDsInList] OF DWORD;
Timeout : TIME := DEFAULT_ADS_TIMEOUT;
END_VAR
```

Name	Туре	Description	
Execute	BOOL	The command is triggered by a rising edge at this input.	
ConnectionHdl	DWORD	Connection handle previously output by the function block UA_Connect.	
NodeHdlCount	UINT	Number of node handles.	
NodeHdls	ARRAY	Array of node handles to be released.	
Timeout	TIME	Time until the function is aborted. DEFAULT_ADS_TIMEOUT is a global constant, set to 5 seconds.	

#### Outputs

```
VAR_OUTPUT

NodeErrorIDs : ARRAY[1..nMaxNodeIDsInList] OF DWORD;

Done : BOOL;

Busy : BOOL;

Error : BOOL;

ErrorID : DWORD;

END_VAR
```

Name	Туре	Description
NodeErrorIDs	ARRAY	Array of error IDs if a node handle could not be released.
Done	BOOL	Switches to TRUE if the function block was executed successfully.
Busy	BOOL	TRUE until the function block has executed a command, at the most for the duration of the "Timeout" at the input. The inputs accept no new command as long as Busy = TRUE. It is not the connection time that is monitored but the reception time.
Error	BOOL	Switches to TRUE if an error occurs while executing a command. The command-specific error code is in nErrID.
ErrorID	DWORD	Contains the error ID if an error occurs.

Development environment	Target platform	PLC libraries to include
TwinCAT 3.1	Win32, Win64, CE-X86, CE-ARM	Tc3_PLCopen_OpcUa

## 5.2.2.14 **UA\_Read**

This function block reads values from a given node and connection handle.

## Inputs

VAR\_INPUT

Execute : BOOL;
ConnectionHdl : DWORD;
NodeHdl : DWORD;
stNodeAddInfo : ST\_UANodeAdditionalInfo;
pVariable : PVOID;
cbData : UDINT;
Timeout : TIME := DEFAULT\_ADS\_TIMEOUT;
END\_VAR

Name	Туре	Description
Execute	BOOL	The command is triggered by a rising edge at this input.
Connection Hdl	DWORD	Connection handle previously output by the function block UA_Connect.
NodeHdl	DWORD	Node handle that was previously output by the function block UA_NodeGetHandle.
stNodeAddI nfo	ST_UANodeAdditionalInfo	Defines additional information, such as which attribute is read from the UA namespace (default: 'Value' attribute) or which IndexRange is to be used. Specified by STRUCT ST UANodeAdditionalInfo [ 60].
pVariable	PVOID	Pointer to data memory where the read data is to be stored.
cbData	UDINT	Determines the size of the data to be read.
Timeout	TIME	Time until the function is aborted.  DEFAULT_ADS_TIMEOUT is a global constant, set to 5 seconds.

#### Outputs

```
VAR_OUTPUT

Done : BOOL;
Busy : BOOL;
Error : BOOL;
ErrorID : UDINT;
cbData_R : UDINT;
END_VAR
```

Name	Туре	Description
Done	BOOL	Switches to TRUE if the function block was executed successfully.
Busy	BOOL	TRUE until the function block has executed a command, at the most for the duration of the "Timeout" at the input. The inputs accept no new command as long as Busy = TRUE. It is not the connection time that is monitored but the reception time.
Error	BOOL	Switches to TRUE if an error occurs while executing a command. The command-specific error code is contained in nErrID.
ErrorID	UDINT	Contains the command-specific ADS error code of the most recently executed command.
cbData_R	UDINT	Number of bytes to be read.

#### Requirements

Development environment	Target platform	PLC libraries to include
TwinCAT 3.1	Win32, Win64, CE-X86, CE-ARM	Tc3_PLCopen_OpcUa

## 5.2.2.15 UA\_ReadList

```
UA_ReadList

Execute BOOL

ConnectionHdl DWORD

NodeHdlCount UINT

NodeHdls ARRAY[I...nMaxNodeIDsInList] OF DWORD

stNodeAddinfo ARRAY[I...nMaxNodeIDsInList] OFST_UANodeAdditionalInfo

pylariable PVOID

cbData ARRAY[1...nMaxNodeIDsInList] OF UDINT

cbDataTotal UDINT

Timeout TIME
```

This function block reads values from several given node and connection handles.

#### Inputs

```
VAR_INPUT

Execute : BOOL;
ConnectionHdl : DWORD;
NodeHdlCount : UINT;
NodeHdls : ARRAY[1..nMaxNodeIDsInList] OF DWORD;
stNodeAddInfo : ARRAY[1..nMaxNodeIDsInList] OF ST_UANodeAdditionalInfo;
pVariable : PVOID;
cbData : ARRAY[1..nMaxNodeIDsInList] UDINT;
cbData : UDINT;
Timeout : TIME := DEFAULT_ADS_TIMEOUT;
END_VAR
```

Name	Туре	Description	
Execute	BOOL	The command is triggered by a rising edge at this input.	
ConnectionHdl	DWORD	Connection handle previously output by the function block <u>UA Connect</u> [ <u>▶ 65</u> ].	
NodeHdlCount	UINT	Number of node handles stored in the input variable NodeHdls.	
NodeHdls	ARRAY	Array of node handles previously received by the function block UA NodeGetHandle [ > 76] or UA NodeGetHandleList [ > 77].	
stNodeAddInfo	ARRAY	Defines additional information, such as which attribute is read from the namespace (default: 'Value' attribute) or which IndexRange is to be us Specified by STRUCT <u>ST_UANodeAdditionalInfo</u> [• 60].	
pVariable	PVOID	Pointer to data memory where the read data is to be stored.	
cbData	ARRAY	Determines the size of the data to be read.	
cbDataTotal	UDINT	Total size of the data to be received.	
Timeout	TIME	Time until the function is aborted. DEFAULT_ADS_TIMEOUT is a global constant, set to 5 seconds.	

#### Outputs

VAR\_OUTPUT
Done : BOOL;
Busy : BOOL;
Error : BOOL;
ErrorID : UDINT;
cbData\_R : UDINT;
END\_VAR

Name	Type	Description
Done	BOOL	Switches to TRUE if the function block was executed successfully.
Busy	BOOL	TRUE until the function block has executed a command, at the most for the duration of the "Timeout" at the input. The inputs accept no new command as long as Busy = TRUE. It is not the connection time that is monitored but the reception time.
Error	BOOL	Switches to TRUE if an error occurs while executing a command. The command-specific error code is in nErrID.
ErrorID	UDINT	Contains the command-specific ADS error code of the most recently executed command.
cbData_R	UDINT	Number of bytes read.

#### Requirements

Development environment	Target platform	PLC libraries to include
TwinCAT 3.1	Win32, Win64, CE-X86, CE-ARM	Tc3_PLCopen_OpcUa

### 5.2.2.16 **UA\_Write**

This function block writes values to a given node and connection handle.

## Inputs

VAR INPUT

R\_INPUT

Execute : BOOL;

ConnectionHdl : DWORD;

NodeHdl : DWORD;

stNodeAddInfo : ST\_UANodeAdditionalInfo;
pVariable : PVOID;
cbData : UDINT;
Timeout : TIME := DEFAULT\_ADS\_TIMEOUT;
D\_VAR

END\_VAR

Name	Туре	Description
Execute	BOOL	The command is triggered by a rising edge at this input.
ConnectionHdl	DWORD	Connection handle previously output by the function
		block <u>UA Connect [▶ 65]</u> .
NodeHdl	DWORD	Node handle that was previously output by the
		function block <u>UA_NodeGetHandle</u> [▶ <u>76</u> ].
stNodeAddInfo	ST_UANodeAdditionalInfo	Defines additional information, e.g. which IndexRange or which attribute is to be written (by default, the' Value' attribute is used). Specified by STRUCT ST UANodeAdditionalInfo [• 60].
pVariable	PVOID	Pointer to data to be written.
cbData	UDINT	Sets the size of the values to be written.
Timeout	TIME	Time until the function is aborted.  DEFAULT_ADS_TIMEOUT is a global constant, set to 5 seconds.

## Outputs

VAR OUTPUT
Done : BOOL;
Busy : BOOL;
Error : BOOL;
ErrorID : DWORD;

END\_VAR

Name	Туре	Description
Done	BOOL	Switches to TRUE if the function block was executed successfully.
Busy	BOOL	TRUE until the function block has executed a command, at the most for the duration of the "Timeout" at the input. The inputs accept no new command as long as Busy = TRUE. It is not the connection time that is monitored but the reception time.
Error	BOOL	Switches to TRUE if an error occurs while executing a command. The command-specific error code is included in ErrorID.
ErrorID	DWORD	Contains the command-specific ADS error code of the most recently executed command.

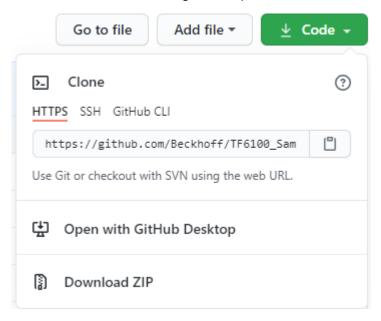

#### Requirements

Development environment	Target platform	PLC libraries to include
TwinCAT 3.1	Win32, Win64, CE-X86, CE-ARM	Tc3_PLCopen_OpcUa

# 6 Samples

Sample code and configurations for this product can be obtained from the corresponding repository on GitHub: <a href="https://github.com/Beckhoff/TF6100">https://github.com/Beckhoff/TF6100</a> Samples. There you have the option to clone the repository or download a ZIP file containing the sample.

The following samples exist:

Name	TwinCAT Version	Description
TF6100_OpcUa_Client_Sample	TwinCAT 3	This sample contains sample code for various functions of the TwinCAT OPC UA Client (PLCOpen function blocks). These include Browse, Connect, HistoryUpdate, MethodCall, Read and Write. The server sample for access is also included.
TF6100_OpcUa_Server_Sample	TwinCAT 3	This sample contains a PLC with extensive provision of PLC data for the TwinCAT OPC UA server (OPC UA Data Access).
TS6100_OpcUa_Client_Sample	TwinCAT 2	This sample contains sample code for various functions of the TwinCAT OPC UA Client (PLCOpen function blocks). These include MethodCall, Read and Write.

# 7 Appendix

# 7.1 Error diagnosis

In the following sections, possible errors for all components of the OPC UA setup are shown in the form of a table. In addition, helpful troubleshooting hints are provided for the respective errors.

Behavior	Remedy
The attempt to read or write a StructuredDataType from a server using the PLCopen function blocks fails.	Structured Data Types are not supported by the PLCopen-based client. Please use the I/O client for this purpose.
When the PLCopen function blocks are executed, the Busy output remains TRUE, but no error is output and the timeout is not triggered.	This is an indication of insufficient ADS router memory. Please increase your router memory in the corresponding settings of the TwinCAT ADS router.
When creating a new I/O client by specifying the Server URL with the host name of the server, no connection can be established subsequently via the AddNodes dialog.	Please check if name resolution is operational in your network. Alternatively try again via the IP address of the server.
Some configuration items from the I/O client are not present, although they should be according to the documentation.	In this case, the System Manager description file (TMC) was probably not updated after a TF6100 update. Please execute the command "Reload TMC" from the context menu of the I/O client to reload the description file.
Write commands to a variable are not executed by the I/O client or do not reach the server.	Please check whether the "Write Enable" output has been enabled on the I/O client.

## 7.2 Status codes

### 7.2.1 ADS Return Codes

Grouping of error codes:

Global error codes: ADS Return Codes [ > 85]... (0x9811\_0000 ...)

Router error codes: ADS Return Codes [ > 86]... (0x9811\_0500 ...)

General ADS errors: ADS Return Codes [ > 86]... (0x9811\_0700 ...)

RTime error codes: ADS Return Codes [ > 88]... (0x9811\_1000 ...)

Global error codes

Hex	Dec	HRESULT	Name	Description
0x0	0	0x98110000	ERR_NOERROR	No error.
0x1	1	0x98110001	ERR_INTERNAL	Internal error.
0x2	2	0x98110002	ERR_NORTIME	No real time.
0x3	3	0x98110003	ERR_ALLOCLOCKEDMEM	Allocation locked – memory error.
0x4	4	0x98110004	ERR_INSERTMAILBOX	Mailbox full – the ADS message could not be sent. Reducing the number of ADS messages per cycle will help.
0x5	5	0x98110005	ERR_WRONGRECEIVEHMSG	Wrong HMSG.
0x6	6	0x98110006	ERR_TARGETPORTNOTFOUND	Target port not found – ADS server is not started or is not reachable.
0x7	7	0x98110007	ERR_TARGETMACHINENOTFOUND	Target computer not found – AMS route was not found.
0x8	8	0x98110008	ERR_UNKNOWNCMDID	Unknown command ID.
0x9	9	0x98110009	ERR_BADTASKID	Invalid task ID.
0xA	10	0x9811000A	ERR_NOIO	No IO.
0xB	11	0x9811000B	ERR_UNKNOWNAMSCMD	Unknown AMS command.
0xC	12	0x9811000C	ERR_WIN32ERROR	Win32 error.
0xD	13	0x9811000D	ERR_PORTNOTCONNECTED	Port not connected.
0xE	14	0x9811000E	ERR_INVALIDAMSLENGTH	Invalid AMS length.
0xF	15	0x9811000F	ERR_INVALIDAMSNETID	Invalid AMS Net ID.
0x10	16	0x98110010	ERR_LOWINSTLEVEL	Installation level is too low –TwinCAT 2 license error.
0x11	17	0x98110011	ERR_NODEBUGINTAVAILABLE	No debugging available.
0x12	18	0x98110012	ERR_PORTDISABLED	Port disabled – TwinCAT system service not started.
0x13	19	0x98110013	ERR_PORTALREADYCONNECTED	Port already connected.
0x14	20	0x98110014	ERR_AMSSYNC_W32ERROR	AMS Sync Win32 error.
0x15	21	0x98110015	ERR_AMSSYNC_TIMEOUT	AMS Sync Timeout.
0x16	22	0x98110016	ERR_AMSSYNC_AMSERROR	AMS Sync error.
0x17	23	0x98110017	ERR_AMSSYNC_NOINDEXINMAP	No index map for AMS Sync available.
0x18	24	0x98110018	ERR_INVALIDAMSPORT	Invalid AMS port.
0x19	25	0x98110019	ERR_NOMEMORY	No memory.
0x1A	26	0x9811001A	ERR_TCPSEND	TCP send error.
0x1B	27	0x9811001B	ERR_HOSTUNREACHABLE	Host unreachable.
0x1C	28	0x9811001C	ERR_INVALIDAMSFRAGMENT	Invalid AMS fragment.
0x1D	29	0x9811001D	ERR_TLSSEND	TLS send error – secure ADS connection failed.
0x1E	30	0x9811001E	ERR_ACCESSDENIED	Access denied – secure ADS access denied.

#### **Router error codes**

Hex	Dec	HRESULT	Name	Description
0x500	1280	0x98110500	ROUTERERR_NOLOCKEDMEMORY	Locked memory cannot be allocated.
0x501	1281	0x98110501	ROUTERERR_RESIZEMEMORY	The router memory size could not be changed.
0x502	1282	0x98110502	ROUTERERR_MAILBOXFULL	The mailbox has reached the maximum number of possible messages.
0x503	1283	0x98110503	ROUTERERR_DEBUGBOXFULL	The Debug mailbox has reached the maximum number of possible messages.
0x504	1284	0x98110504	ROUTERERR_UNKNOWNPORTTYPE	The port type is unknown.
0x505	1285	0x98110505	ROUTERERR_NOTINITIALIZED	The router is not initialized.
0x506	1286	0x98110506	ROUTERERR_PORTALREADYINUSE	The port number is already assigned.
0x507	1287	0x98110507	ROUTERERR_NOTREGISTERED	The port is not registered.
0x508	1288	0x98110508	ROUTERERR_NOMOREQUEUES	The maximum number of ports has been reached.
0x509	1289	0x98110509	ROUTERERR_INVALIDPORT	The port is invalid.
0x50A	1290	0x9811050A	ROUTERERR_NOTACTIVATED	The router is not active.
0x50B	1291	0x9811050B	ROUTERERR_FRAGMENTBOXFULL	The mailbox has reached the maximum number for fragmented messages.
0x50C	1292	0x9811050C	ROUTERERR_FRAGMENTTIMEOUT	A fragment timeout has occurred.
0x50D	1293	0x9811050D	ROUTERERR_TOBEREMOVED	The port is removed.

#### **General ADS error codes**

0.700         1792         0.988110700         ADSERR DEVICE_ERROR         General device error.           0.701         1793         0.988110700         ADSERR DEVICE_INVALIDORP         Service is not supported by the server.           0.702         1795         0.988110703         ADSERR DEVICE_INVALIDORESE         Invalid index order.           0.704         1796         0.988110703         ADSERR DEVICE_INVALIDORES         Reading or writing not permitted.           0.707         1797         0.988110705         ADSERR_DEVICE_INVALIDORATA         Invalid index orders.           0.707         1799         0.988110707         ADSERR_DEVICE_INVALIDORATA         Invalid data values.           0.7070         1890         0.988110709         ADSERR_DEVICE_INVALIDORATA         Invalid data values.           0.7070         1801         0.988110709         ADSERR_DEVICE_INVALIDORATA         Invalid operating system context. This can result from use of ADS blocks in different tasks. It may be possible to resolve this through multitasking synchronization in the PLT.           0.7070         1802         0.988110700         ADSERR_DEVICE_INVALIDORATM         Invalid operating system context. This can result from use of ADS blocks in different tasks. It may be possible to resolve this through multitasking synchronization in the PLT.           0.7070         1802         0.988110700         ADSERR_DEVICE_INTORNOMAN	Hex	Dec	HRESULT	Name	Description
0x701         1793         0x88110701         ADSERR DEVICE_INVALIDORP         Service is not supported by the server.           0x702         1796         0x88110703         ADSERR_DEVICE_INVALIDORFSET         Invalid index group.           0x703         1796         0x88110703         ADSERR_DEVICE_INVALIDORFSET         Invalid index offset.           0x706         1797         0x88110704         ADSERR_DEVICE_INVALIDORTSET         Invalid index offset.           0x706         1797         0x88110707         ADSERR_DEVICE_INVALIDATA         Invalid data values.           0x707         1798         0x88110709         ADSERR_DEVICE_INVALIDATA         Device is not ready to operate.           0x708         1800         0x88110709         ADSERR_DEVICE_INVALIDONTEXT         Device is not ready to operate.           0x709         1801         0x88110709         ADSERR_DEVICE_INVALIDONTEXT         Invalid operating system context. This can result from use of ADS blocks in different tasks. It may be possible to resolve this through multitasking synchronization in the PLC.           0x700         1803         0x88110709         ADSERR_DEVICE_INVALIDARM         Invalid operating system context. This can result from use of ADS blocks in different tasks. It may be possible to resolve this through the synchronization in the PLC.           0x700         1803         0x88110709         ADSERR_DEVICE_INVALIDARM <t< td=""><td></td><td></td><td></td><td></td><td></td></t<>

0x736 1846 0x98110736 ADSERR_DEVICE_LICENSEPLATFORM Invalid platform level.	0x735	1845	0x98110735	ADSERR_DEVICE_INVALIDALIGNMENT	Invalid alignment.
	0x736	1846	0x98110736	ADSERR_DEVICE_LICENSEPLATFORM	Invalid platform level.

Hex	Dec	HRESULT	Name	Description
0x737	1847	0x98110737	ADSERR_DEVICE_FORWARD_PL	Context – forward to passive level.
0x738	1848	0x98110738	ADSERR_DEVICE_FORWARD_DL	Context – forward to dispatch level.
0x739	1849	0x98110739	ADSERR_DEVICE_FORWARD_RT	Context – forward to real time.
0x740	1856	0x98110740	ADSERR_CLIENT_ERROR	Client error.
0x741	1857	0x98110741	ADSERR_CLIENT_INVALIDPARM	Service contains an invalid parameter.
0x742	1858	0x98110742	ADSERR_CLIENT_LISTEMPTY	Polling list is empty.
0x743	1859	0x98110743	ADSERR_CLIENT_VARUSED	Var connection already in use.
0x744	1860	0x98110744	ADSERR_CLIENT_DUPLINVOKEID	The called ID is already in use.
0x745	1861	0x98110745	ADSERR_CLIENT_SYNCTIMEOUT	Timeout has occurred – the remote terminal is not responding in the specified ADS timeout. The route setting of the remote terminal may be configured incorrectly.
0x746	1862	0x98110746	ADSERR_CLIENT_W32ERROR	Error in Win32 subsystem.
0x747	1863	0x98110747	ADSERR_CLIENT_TIMEOUTINVALID	Invalid client timeout value.
0x748	1864	0x98110748	ADSERR_CLIENT_PORTNOTOPEN	Port not open.
0x749	1865	0x98110749	ADSERR_CLIENT_NOAMSADDR	No AMS address.
0x750	1872	0x98110750	ADSERR_CLIENT_SYNCINTERNAL	Internal error in Ads sync.
0x751	1873	0x98110751	ADSERR_CLIENT_ADDHASH	Hash table overflow.
0x752	1874	0x98110752	ADSERR_CLIENT_REMOVEHASH	Key not found in the table.
0x753	1875	0x98110753	ADSERR_CLIENT_NOMORESYM	No symbols in the cache.
0x754	1876	0x98110754	ADSERR_CLIENT_SYNCRESINVALID	Invalid response received.
0x755	1877	0x98110755	ADSERR_CLIENT_SYNCPORTLOCKED	Sync Port is locked.
0x756	1878	0x98110756	ADSERR_CLIENT_REQUESTCANCELLED	The request was cancelled.

#### **RTime error codes**

Hex	Dec	HRESULT	Name	Description
0x1000	4096	0x98111000	RTERR_INTERNAL	Internal error in the real-time system.
0x1001	4097	0x98111001	RTERR_BADTIMERPERIODS	Timer value is not valid.
0x1002	4098	0x98111002	RTERR_INVALIDTASKPTR	Task pointer has the invalid value 0 (zero).
0x1003	4099	0x98111003	RTERR_INVALIDSTACKPTR	Stack pointer has the invalid value 0 (zero).
0x1004	4100	0x98111004	RTERR_PRIOEXISTS	The request task priority is already assigned.
0x1005	4101	0x98111005	RTERR_NOMORETCB	No free TCB (Task Control Block) available. The maximum number of TCBs is 64.
0x1006	4102	0x98111006	RTERR_NOMORESEMAS	No free semaphores available. The maximum number of semaphores is 64.
0x1007	4103	0x98111007	RTERR_NOMOREQUEUES	No free space available in the queue. The maximum number of positions in the queue is 64.
0x100D	4109	0x9811100D	RTERR_EXTIRQALREADYDEF	An external synchronization interrupt is already applied.
0x100E	4110	0x9811100E	RTERR_EXTIRQNOTDEF	No external sync interrupt applied.
0x100F	4111	0x9811100F	RTERR_EXTIRQINSTALLFAILED	Application of the external synchronization interrupt has failed.
0x1010	4112	0x98111010	RTERR_IRQLNOTLESSOREQUAL	Call of a service function in the wrong context
0x1017	4119	0x98111017	RTERR_VMXNOTSUPPORTED	Intel VT-x extension is not supported.
0x1018	4120	0x98111018	RTERR_VMXDISABLED	Intel VT-x extension is not enabled in the BIOS.
0x1019	4121	0x98111019	RTERR_VMXCONTROLSMISSING	Missing function in Intel VT-x extension.
0x101A	4122	0x9811101A	RTERR_VMXENABLEFAILS	Activation of Intel VT-x fails.

## Specific positive HRESULT Return Codes:

HRESULT	Name	Description
0x0000_0000	S_OK	No error.
0x0000_0001	S_FALSE	No error. Example: successful processing, but with a negative or incomplete result.
0x0000_0203	S_PENDING	No error. Example: successful processing, but no result is available yet.
0x0000_0256	S_WATCHDOG_TIMEOUT	No error. Example: successful processing, but a timeout occurred.

## **TCP Winsock error codes**

Hex	Dec	Name	Description		
0x274C	10060	WSAETIMEDOUT	A connection timeout has occurred - error while establishing the connection, because the remote terminal did not respond properly after a certain period of time, or the established connection could not be maintained because the connected host did not respond.		
0x274D	10061	WSAECONNREFUSED	Connection refused - no connection could be established because the target computer has explicitly rejected it. This error usually results from an attempt to connect to a service that is inactive on the external host, that is, a service for which no server application is running.		
0x2751	10065	WSAEHOSTUNREACH	No route to host - a socket operation referred to an unavailable host.		
	More Winsock error codes: Win32 error codes				

### 7.2.2 Client I/O

The OPC UA Client modules that belong to a virtual OPC UA device offer different status variables as well as control variables. These variables are explained below.

### Reading the status codes

Please note that the status code of the state machine is listed here in hexadecimal notation. If the code is displayed as a decimal number in TwinCAT, it must be converted for interpretation.

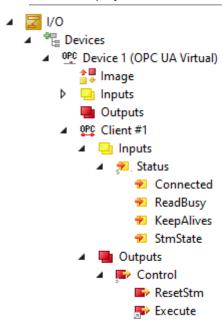

Fig. 1: OPCUAClientModulesStatusCodes

Variable	Schema	0	1- State machine state	2- Keep alive count if using subscriptions	3- Connection state (&read busy)
<b>愛</b> Status	0x0123	-	0 = Initialize (init)		0 = false(&off)
			1 = Connect		1 = true(&off)
			2 = Resolve namespace		2 = false(&on)
			3 = Get node handles		3 = true(&on)
			4 = Continuous read/write		
			5 = Triggered read/write		
			6 = Awaiting data change notifications (subscriptions ))		
			7 = Disconnect		
			8 = Reset		
Control	0x0123	-	-	-	0 = Standard (default) 1 = Reset state machine 2 = Execute (in triggered read mode)
Variable		D	ata type	Description	
▼ Connected		ВІ	Т	1 TRUE   0=	FALSE.
▼ ReadBusy		ВІ	Т	is only active	FALSE. This function when reading and igger variables.
KeepAlives	▼ KeepAlives		T4	messages c	number of KeepAlive ounted. Only active g and writing using s.
StmState     ■		B,	YTE	Can be read	l in the table above.
■ ResetStm		ВІ	Т	The client is set to 1.	reset when this bit is
Execute		ВІ	Т	writing takes	FALSE. Reading/ place if this bit is set eading and writing via bles.
					mains set, there is no o cyclic reading/

## 7.2.3 Client PLCopen

The function blocks of the TwinCAT OPC UA Client have their own error codes, which indicate the occurrence of an error and use an ErrorID to display further information about the problem that has occurred. TwinCAT ADS error messages (ADS Return Codes [ 85]) with the HighWord 0x0000 and custom error messages from the client or the PLC library with the HighWord 0xE4DD can occur.

Possible TwinCAT ADS errors include the following:

Hex	Name	Description
0x 0000 0705	DEVICE_INVALIDSIZE	Parameter size not correct
0x 0000 0706	DEVICE_INVALIDDATA	Invalid parameter values
0x 0000 070A	DEVICE_NOMEMORY	Not enough memory

This error code list shows the possible custom error values:

Hex	Name	Description
0x E4DD 0001	UAC E FAIL	UA service call failed
0x E4DD 0100	UAC E CONNECTED	Server already connected
0x E4DD 0101	UAC E CONNECT	General error when establishing a connection
0x E4DD 0101	UAC E UASECURITY	UA security could not be set up
0x E4DD 0102	UAC E ITEMEXISTS	Element ID already exists
0x E4DD 0103	UAC E ITEMNOTFOUND	Element does not exist
0x E4DD 0104	UAC E ITEMTYPE	
0x E4DD 0105		Invalid or unsupported item type
	UAC_E_CONVERSION	Variable types cannot be converted
0x E4DD 0107	UAC_E_SUSPENDED	Device hangs. Please try again later
0x E4DD 0108	UAC_E_TYPE_NOT_SUPPORTED	Conversion variable type is not supported.
0x E4DD 0109	UAC_E_NSNAME_NOTFOUND	No namespace with the specified name found.
0x E4DD 0110	UAC_E_CONNECT_NOTFOUND	Connection failed: Target host could not be found.
0x E4DD 0111	UAC_E_TIMEOUT	Timeout: i.e. target host does not respond
0x E4DD 0112	UAC_E_INVALIDHDL	Session handle invalid
0x E4DD 0113	UAC_E_INVALIDNODEID	UA node ID unknown
0x E4DD 0114	UAC_E_INVAL_IDENTIFIER_TYPE	Identifier type of UaNodeld invalid
0x E4DD 0115	UAC_E_IDENTIFIER_NOTSUPP	Identifier type UaNodeld is not supported
0x E4DD 0116	UAC_E_INVAL_NODE_HDL	Invalid node handle
0x E4DD 0117	UAC E UAREADFAILED	UA read failed for unknown reasons
0x E4DD 0118	UAC E UAWRITEFAILED	UA write failed for unknown reasons
0x E4DD 0119	UAC E INVAL NODEMETHOD HDL	Invalid method handle
0x E4DD 011A	UAC E CALL FAILED	Call failed, cause unknown
0x E4DD 011B	UAC E CALLDECODE FAILED	Successful call, decoding return value failed
0x E4DD 011C	UAC E NOTMAPPEDTYPE	Unassigned data type in return value
0x E4DD 011D	UAC_E_CALL_FAILED_BADINTERNAL	Call failed with UA_BadInternal
0x E4DD 011E	UAC_E_METHODIDINVALID	Unknown MethodID (returned on call, even if provided by GetMethodHdl)
0x E4DD 011F	UAC_E_TOOMUCHDIM	Method call has returned parameters with more than 3 dimensions; not supported.
0x E4DD 0120	UAC_E_CALL_FAILED_INVALIDARG	Call failed with OpcUa BadInvalidArgument
0x E4DD 0121	UAC_E_CALL_FAILED_TYPEMISMATC H	Call failed with UAC_E_CALL_FAILED_TYPEMISMATCH
0x E4DD 0122	UAC_E_CALL_FAILED_OUTOFRANGE	Call failed with UAC_E_CALL_FAILED_OUTOFRANGE
0x E4DD 0123	UAC_E_CALL_FAILED_BADSTRUCTURE	Call failed with OpcUa_BadStructureMissing
0x E4DD 0124	UAC_E_CALL_TYPEMISMATCH_OUTP ARAM	Call successful, but type of output information provided does not match
0x E4DD 0125	UAC_E_NONVALIDTYPEINFO	Node has insufficient type information
0x E4DD 0126	UAC_E_INVALIDATTRIBID	Access to invalid node attribute
0x E4DD 0128	UAC_E_NOTSUPPORTED	The command is not supported by the connected UaServer, e.g. when calling UA_HistoryUpdate.
0x E4DE 0100	UAC_E_INVALID_ARRAY_LENGTH	An invalid array length not matching DataValueCount was assigned to UA_HistoryUpdate.
0x E4DE 0101	UAC_E_INVALID_DATASIZE	A data value with an invalid data type size was assigned to UA_HistoryUpdate. All assigned DataValues must be of the same data type.

Hex	Name	Description
0x E4DE 0102		A lower-level error was output for at least one of the transferred data values. See ValueErrorIDs at UA_HistoryUpdate.

## 7.3 Support and Service

Beckhoff and their partners around the world offer comprehensive support and service, making available fast and competent assistance with all questions related to Beckhoff products and system solutions.

#### Download finder

Our <u>download finder</u> contains all the files that we offer you for downloading. You will find application reports, technical documentation, technical drawings, configuration files and much more.

The downloads are available in various formats.

#### Beckhoff's branch offices and representatives

Please contact your Beckhoff branch office or representative for <u>local support and service</u> on Beckhoff products!

The addresses of Beckhoff's branch offices and representatives round the world can be found on our internet page: www.beckhoff.com

You will also find further documentation for Beckhoff components there.
